Some basic definitions

- **An alphabet Σ** is a finite set of symbols
- **A string over Σ** is a sequence of symbols from Σ
 - ϵ stands for the empty string
- **The length $|w|$** is the number of symbols in w
- Σ^* denotes this set of all strings over Σ
- **A (formal) language** is a subset of Σ^* for some alphabet Σ

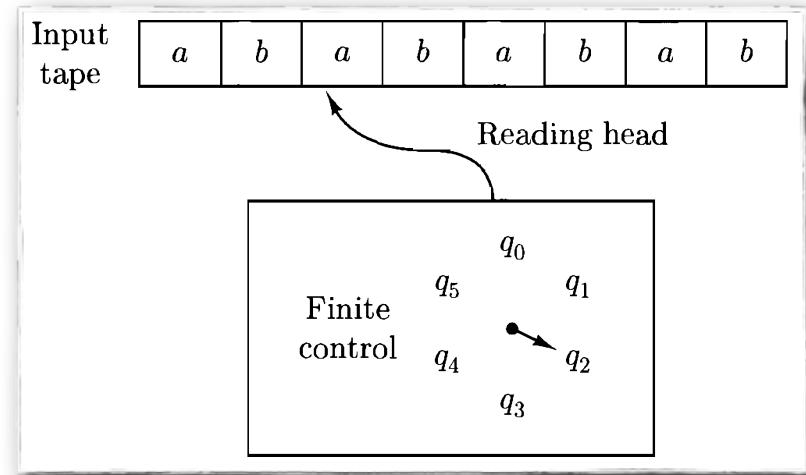

Deterministic Finite Automata

- $M = \langle K, \Sigma, \delta, s, F \rangle$

- K is a finite set of states
- Σ is an input alphabet
- δ is a transition function
- $s \in K$ is the start state
- $F \subseteq K$ is the set of final (accepting) states

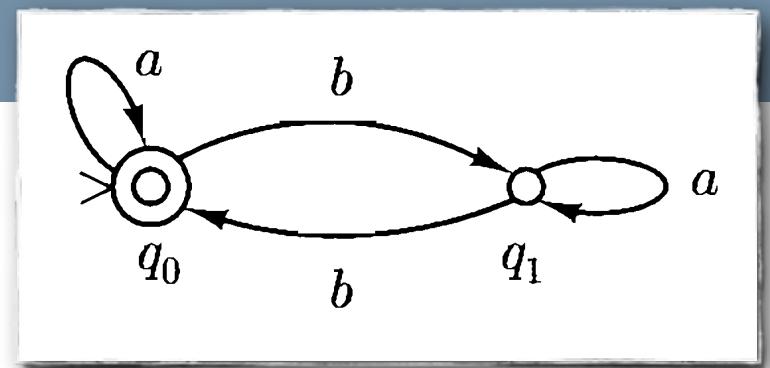

- **Transition function**

- $\delta(q, a) = q'$
- when M is in state q and reads input a , it goes into state q'

Automata as Graphs

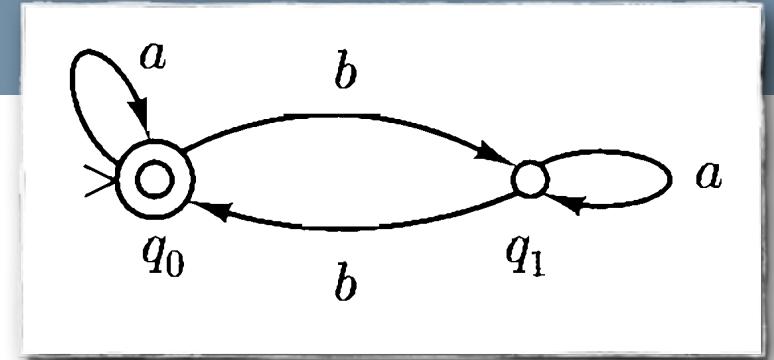

- Nodes = states
- Edges = transition function
 - an edge from state q to state q' labeled by $a \Leftrightarrow \delta(q, a) = q'$
- $>$ marks the start state
- Double circles = final states

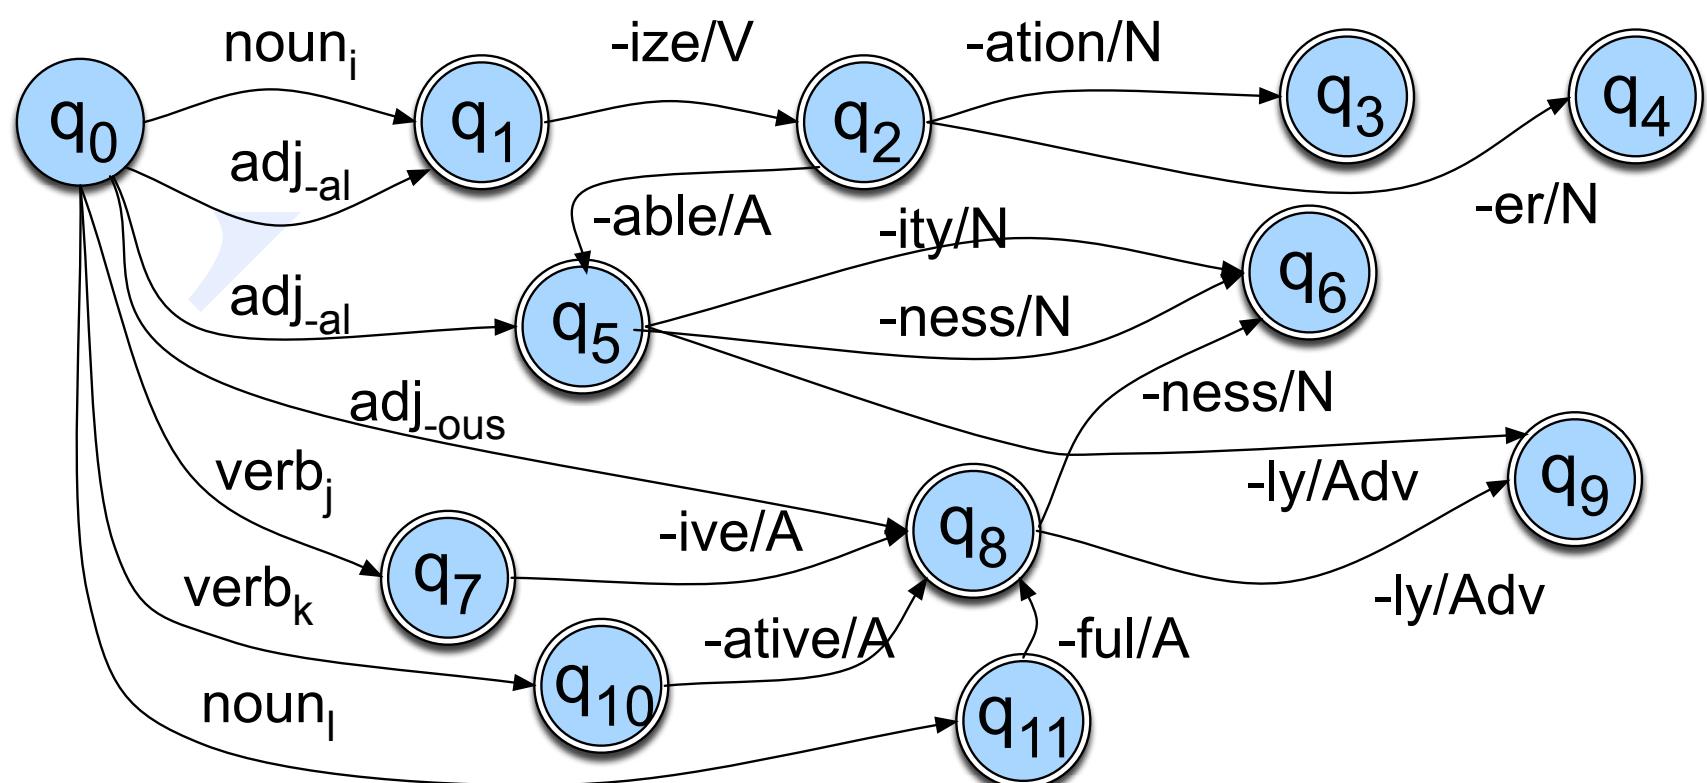

Automata as Graphs

- $M = \langle K, \Sigma, \delta, s, F \rangle$

- $K = \{q_0, q_1\}$
- $\Sigma = \{a, b\}$
- $s = q_0$
- $F = \{q_0\}$
- $\delta(q_0, a) = q_0$
- $\delta(q_0, b) = q_1$
- $\delta(q_1, a) = q_0$
- $\delta(q_0, b) = q_1$

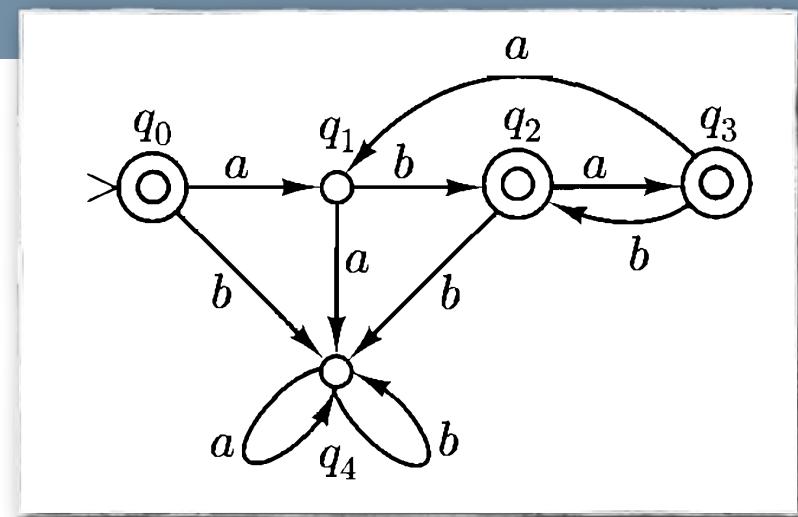

Another Example (from J&M)

More definitions

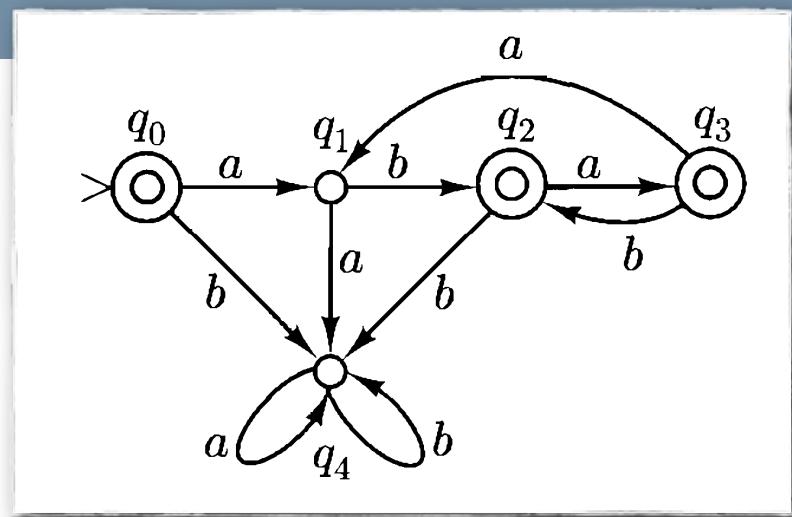

- **A configuration** is a pair $\langle q, w \rangle \in K \times \Sigma^*$
 - q = the current state
 - w = the unread part of the string being processed
- **Yields in one step**
 - $\langle q, w \rangle \vdash_M \langle q', w' \rangle$
 - iff $w = aw'$ for some $a \in \Sigma$, $w' \in \Sigma^*$ and $\delta(q, a) = q'$
- **Yields**
 - \vdash_M^* is the reflexive, transitive closure of \vdash_M
- **The language accepted** by a DFA $M = \langle K, \Sigma, \delta, s, F \rangle$
 - $L(M) = \{ w \mid \langle s, w \rangle \vdash_M^* \langle q, \varepsilon \rangle \text{ for some } q \in F \}$

An Example

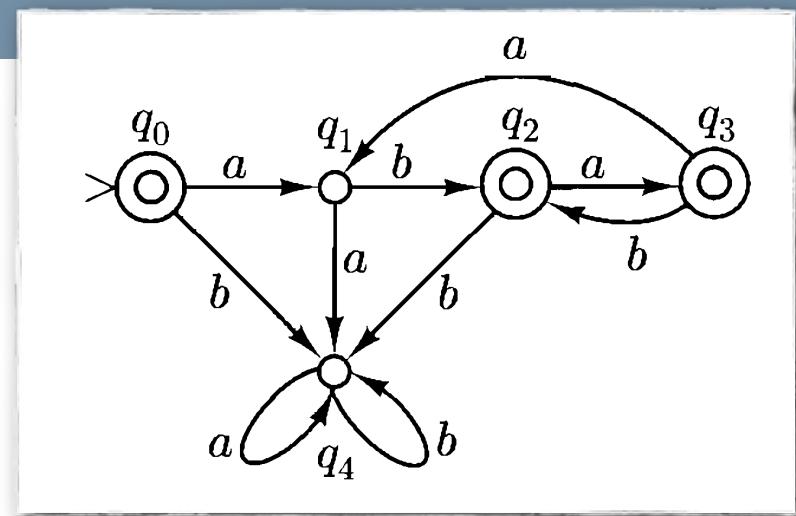

An Example

$\langle q_0, \text{ababa} \rangle \vdash_M \langle q_1, \text{baba} \rangle$

An Example

$\langle q_0, ababa \rangle \vdash_M \langle q_1, baba \rangle$
 $\vdash_M \langle q_2, aba \rangle$

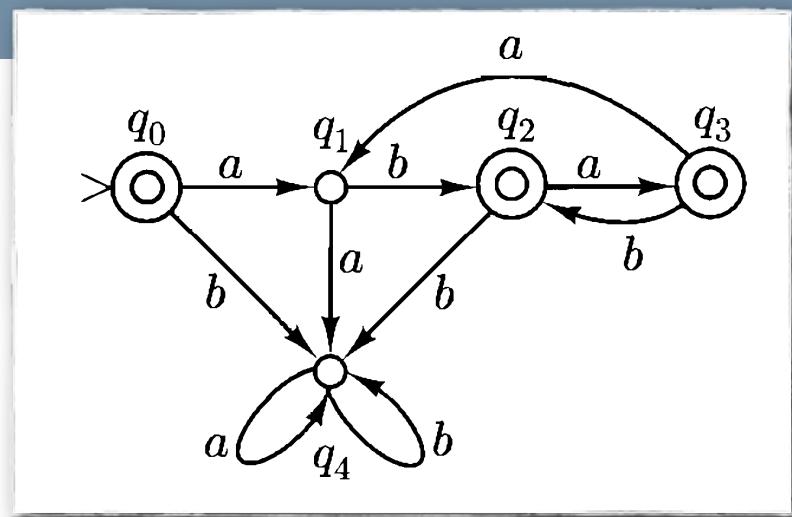

An Example

$\langle q_0, ababa \rangle \vdash_M \langle q_1, baba \rangle$

$\vdash_M \langle q_2, aba \rangle$

$\vdash_M \langle q_3, ba \rangle$

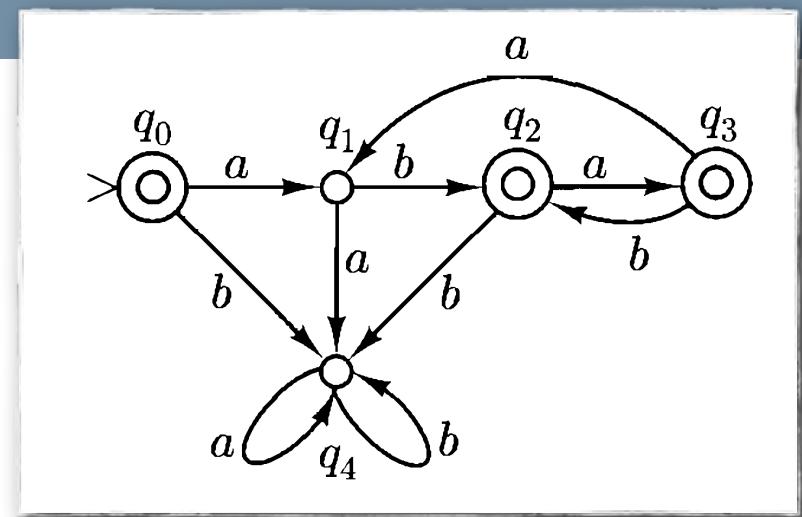

An Example

$\langle q_0, ababa \rangle \vdash_M \langle q_1, baba \rangle$

$\vdash_M \langle q_2, aba \rangle$

$\vdash_M \langle q_3, ba \rangle$

$\vdash_M \langle q_2, a \rangle$

An Example

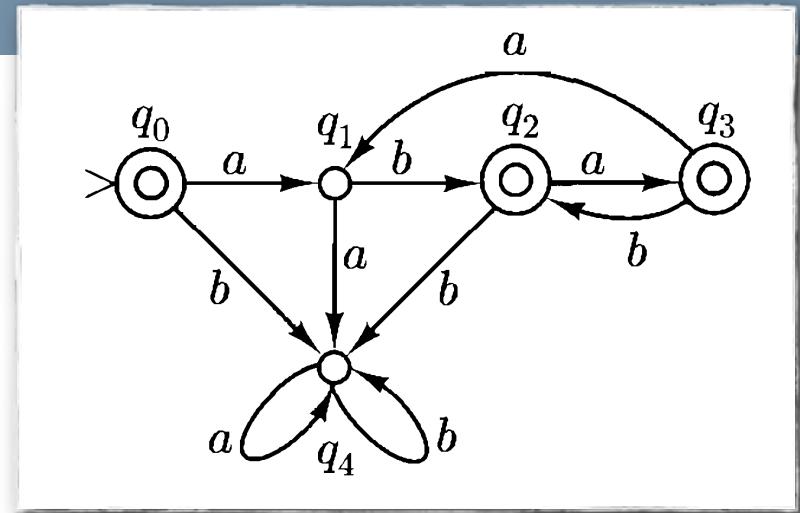

$\langle q_0, ababa \rangle \vdash_M \langle q_1, baba \rangle$

$\vdash_M \langle q_2, aba \rangle$

$\vdash_M \langle q_3, ba \rangle$

$\vdash_M \langle q_2, a \rangle$

$\vdash_M \langle q_3, \varepsilon \rangle$

An Example

$\langle q_0, ababa \rangle \vdash_M \langle q_1, baba \rangle$

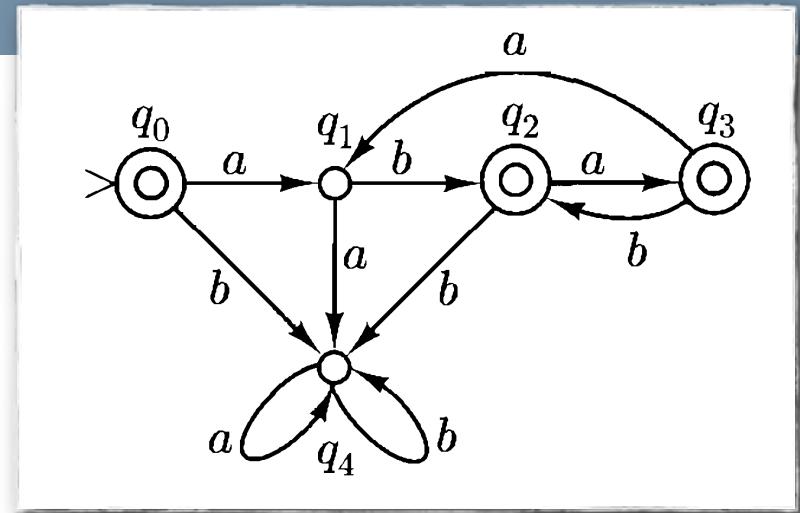

$\vdash_M \langle q_2, aba \rangle$

$\vdash_M \langle q_3, ba \rangle$

$\vdash_M \langle q_2, a \rangle$

$\vdash_M \langle q_3, \varepsilon \rangle$

$\Rightarrow ababa \in L(M)$

An Example

$\langle q_0, ababa \rangle \vdash_M \langle q_1, baba \rangle$

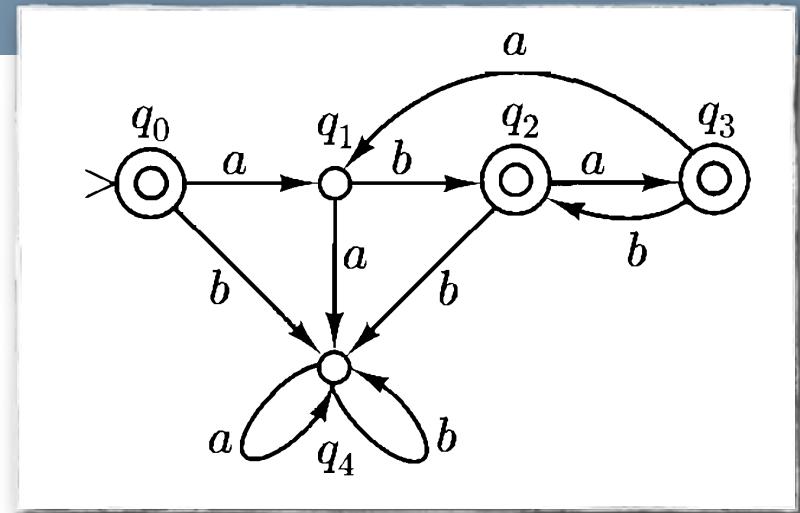

$\vdash_M \langle q_2, aba \rangle$

$\vdash_M \langle q_3, ba \rangle$

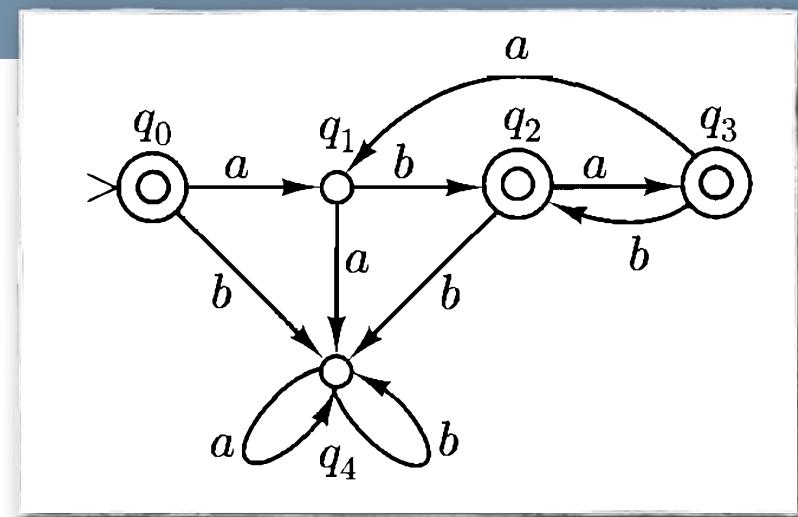

$\vdash_M \langle q_2, a \rangle$

$\vdash_M \langle q_3, \varepsilon \rangle$

$\Rightarrow ababa \in L(M)$

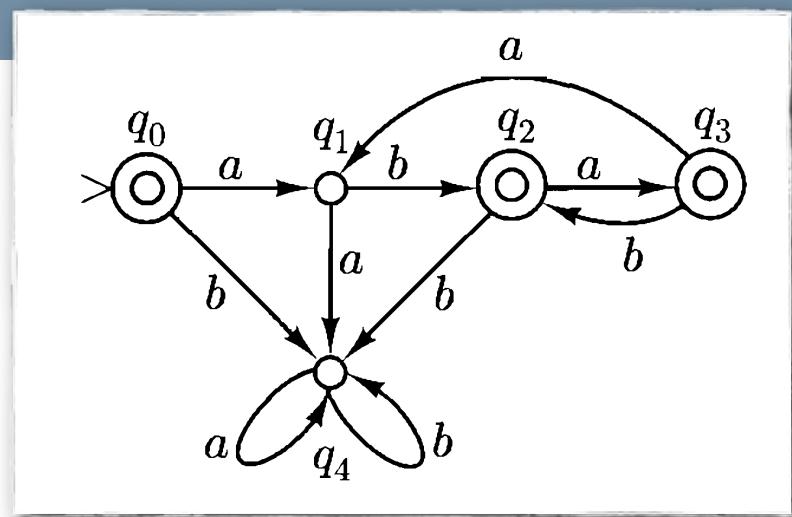

An Example

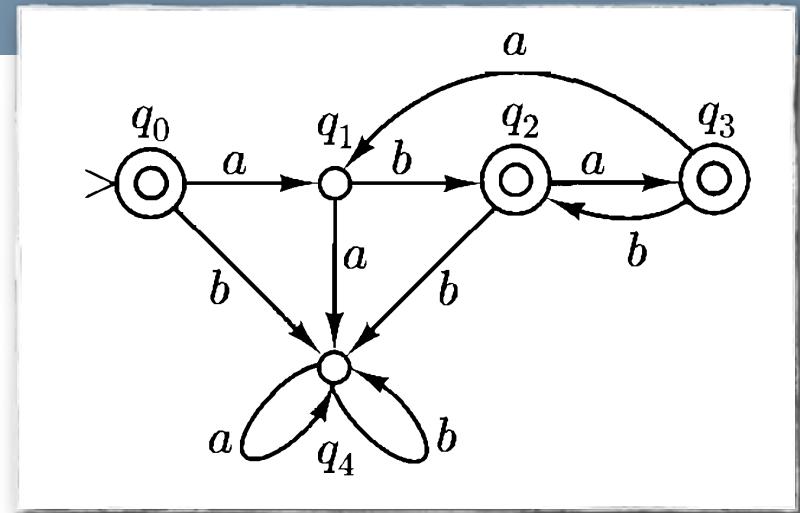

An Example

$$\langle q_0, abaa \rangle \vdash_M \langle q_1, baa \rangle$$

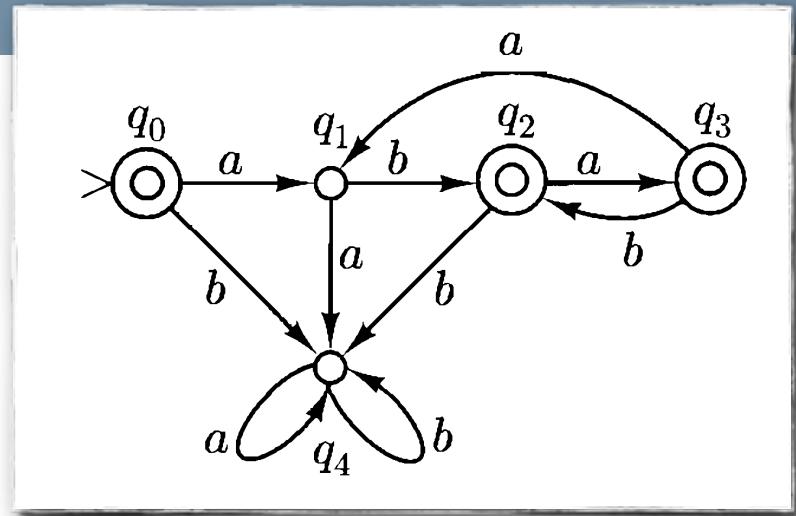

An Example

$\langle q_0, abaa \rangle \vdash_M \langle q_1, baa \rangle$
 $\vdash_M \langle q_2, ba \rangle$

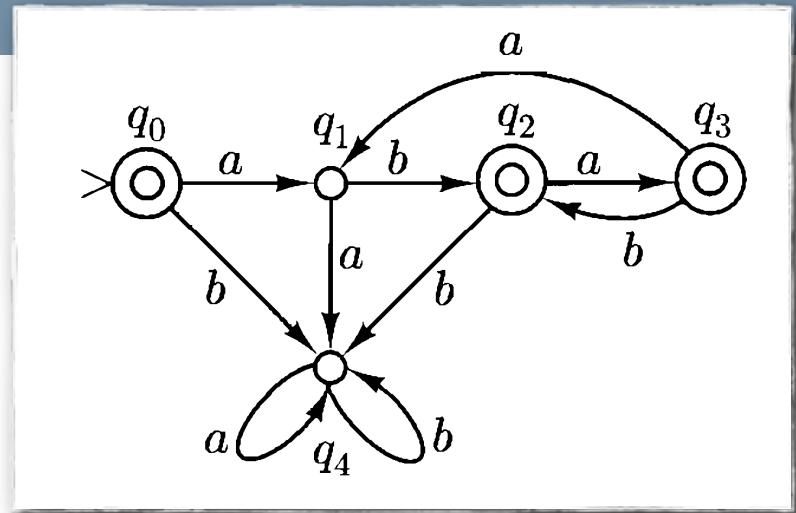

An Example

$\langle q_0, abaa \rangle \vdash_M \langle q_1, baa \rangle$
 $\vdash_M \langle q_2, ba \rangle$
 $\vdash_M \langle q_3, a \rangle$

An Example

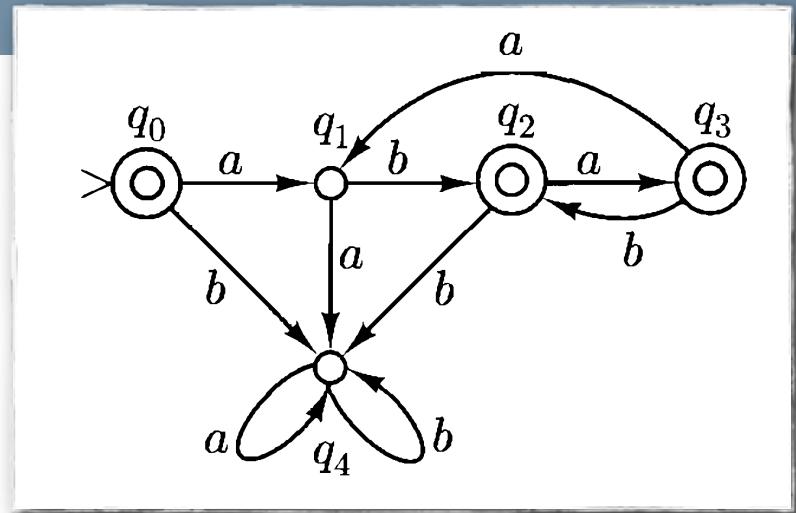

$\langle q_0, abaa \rangle \vdash_M \langle q_1, baa \rangle$
 $\vdash_M \langle q_2, ba \rangle$
 $\vdash_M \langle q_3, a \rangle$
 $\vdash_M \langle q_1, \varepsilon \rangle$

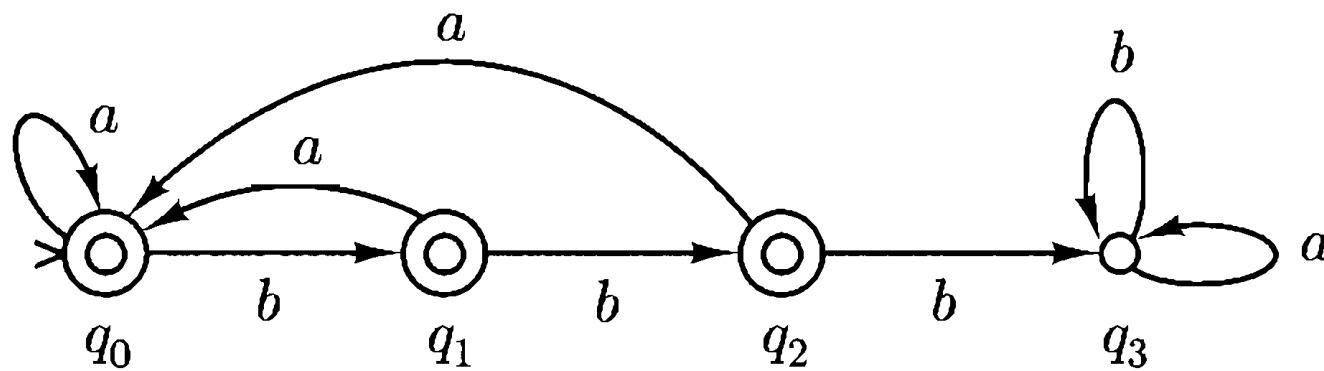

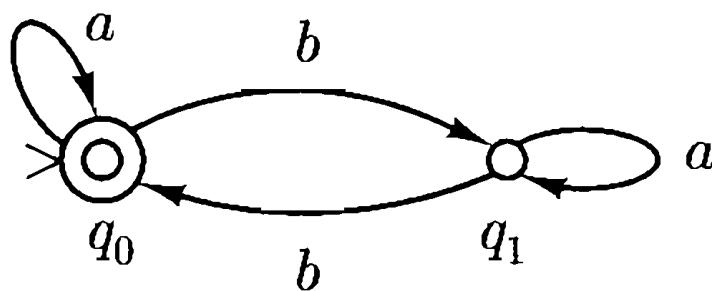

An Example

$\langle q_0, abaa \rangle \vdash_M \langle q_1, baa \rangle$
 $\vdash_M \langle q_2, ba \rangle$
 $\vdash_M \langle q_3, a \rangle$
 $\vdash_M \langle q_1, \varepsilon \rangle$

$\Rightarrow abaa \notin L(M)$

Exercise: $L(M) = ?$

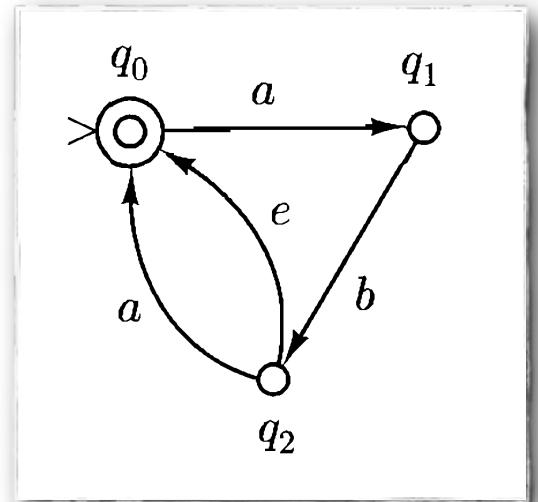

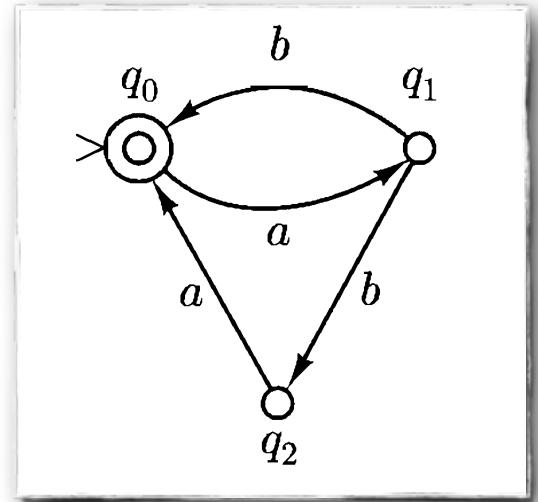

Recognition Algorithm

```
function RECOGNIZE(DFA M, STRING input)
    index ← 0
    state ← start state of M
    while index < length(input) do
        state ← trans[state, input[index]]
        index ← index + 1
    end
    if state is a final state of M
        then return accept
        else return reject
    end
```

Nondeterministic Automata

- Nondeterministic finite automata:
 - several symbols can be read at once, or none at all
 - several possible next states

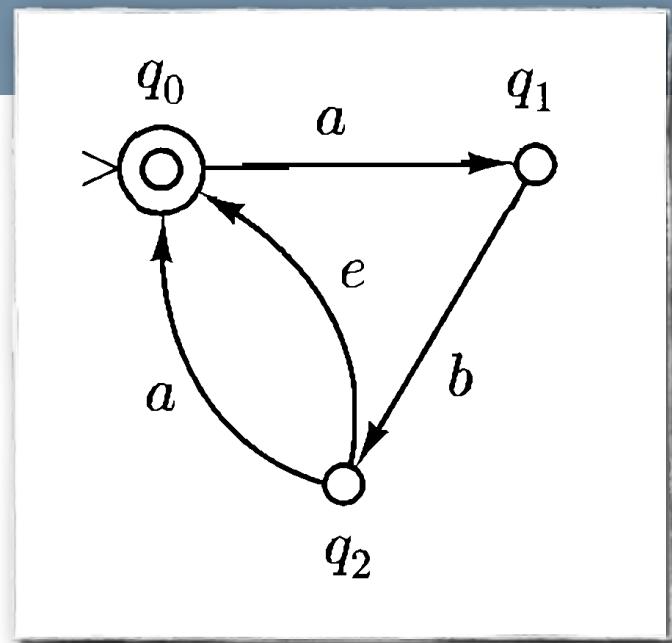

Nondeterministic Automata

- **$M = \langle K, \Sigma, \Delta, s, F \rangle$**
 - K is a finite set of states
 - Σ is an input alphabet
 - $\Delta \subseteq K \times \Sigma^* \times K$ is a finite transition relation
 - $s \in K$ is the start state
 - $F \subseteq K$ is the set of final (accepting) states
- **Transition relation** $\Delta \subseteq K \times \Sigma^* \times K$
 - $\langle q, w, q' \rangle \in \Delta$ = when the automaton is in state q and reads input w , it can go into state q'
 - Note: here we restrict ourself to NFA where $|w| \leq 1$

An Example

- $M = \langle K, \Sigma, \Delta, s, F \rangle$
 - $K = \{q_0, q_1, q_2\}$
 - $\Sigma = \{a, b\}$
 - $s = q_0$
 - $F = \{q_0\}$
 - $\Delta = \{(q_0, a, q_1), (q_1, b, q_2), (q_2, a, q_0), (q_2, \varepsilon, q_0)\}$

Configurations

- **Configurations**

- are elements from $K \times \Sigma^*$ (as before)

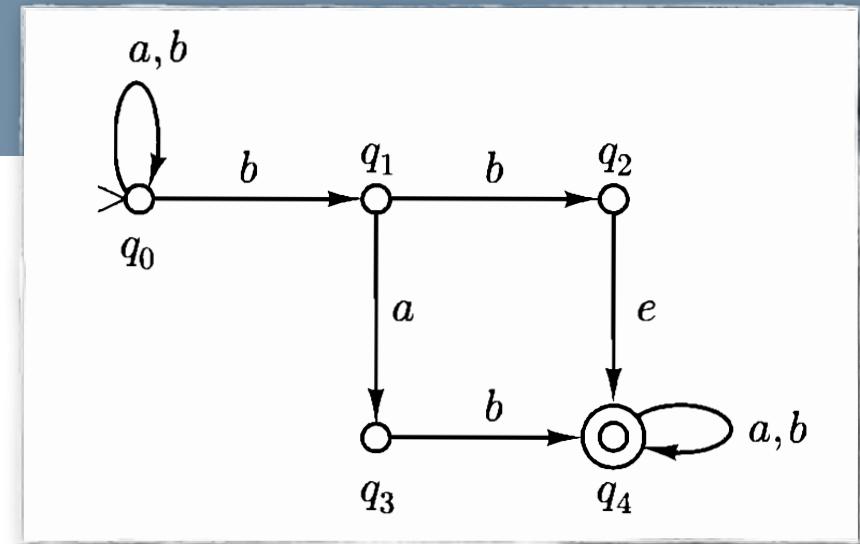

- **Yields in one step**

- $\langle q, w \rangle \vdash_M \langle q', w' \rangle$
 - iff $w = uw'$ for some $u, w \in \Sigma^*$ and $\langle q, u, q' \rangle \in \Delta$

- **The language accepted** by an NFA

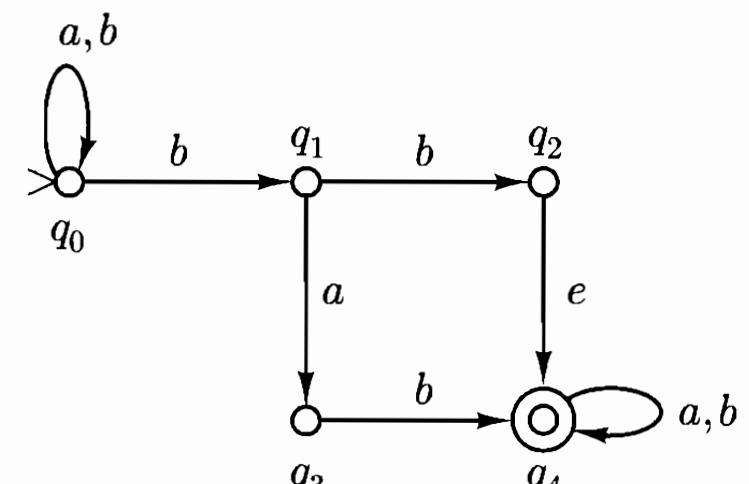

- $L(M) = \{ w \mid \langle s, w \rangle \vdash_M^* \langle q, \varepsilon \rangle \text{ for some } q \in F \}$

An Example

$\langle q_0, \text{babba} \rangle$

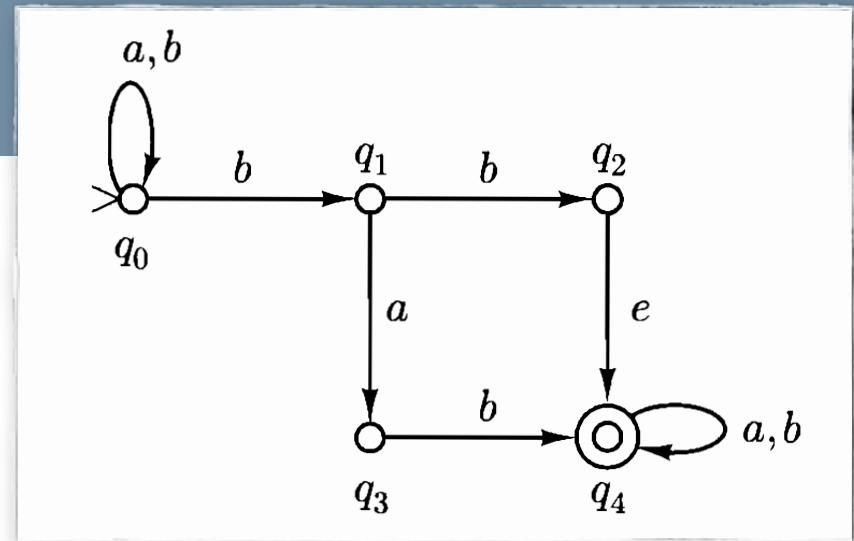

An Example

$\langle q_0, \text{babba} \rangle$

NFA = DFA (preliminary)

- **Theorem:** for every NFA $M = \langle K, \Sigma, \Delta, s, F \rangle$ there is an equivalent DFA M' such that $L(M) = L(M')$
- Let us first consider the special case where for all elements $\langle q, w, q' \rangle \in \Delta$, w is a string of length 1
- We construct the DFA $M' = \langle K', \Sigma, \delta, s', F' \rangle$ as follows:
 - $K' = 2^K$
 - $s' = \{s\}$
 - $\delta(Q, a) = \{ k \in K \mid \langle q, a, k \rangle \in \Delta \text{ for some } q \in Q \}$
 - for all $Q \subseteq K, a \in \Sigma$
 - $F' = \{ Q \subseteq K \mid Q \cap F \neq \emptyset \}$

NFA = DFA (preliminary)

- **Theorem:** for every NFA $M = \langle K, \Sigma, \Delta \rangle$ there exists an equivalent DFA M' such that $L(M) = L(M')$
- Let us first consider the special case where all transitions are of the form $\langle q, w, q' \rangle \in \Delta$, w is a string of length 1
- We construct the DFA $M' = \langle K', \Sigma, \delta, s', F' \rangle$ as follows:
 - $K' = 2^K$
 - $s' = \{s\}$
 - $\delta(Q, a) = \{ k \in K' \mid \langle q, a, k \rangle \in \Delta \text{ for some } q \in Q \}$
 - for all $Q \subseteq K$, $a \in \Sigma$
 - $F' = \{ Q \subseteq K \mid Q \cap F \neq \emptyset \}$

ε -Closure

■ ε -Closure

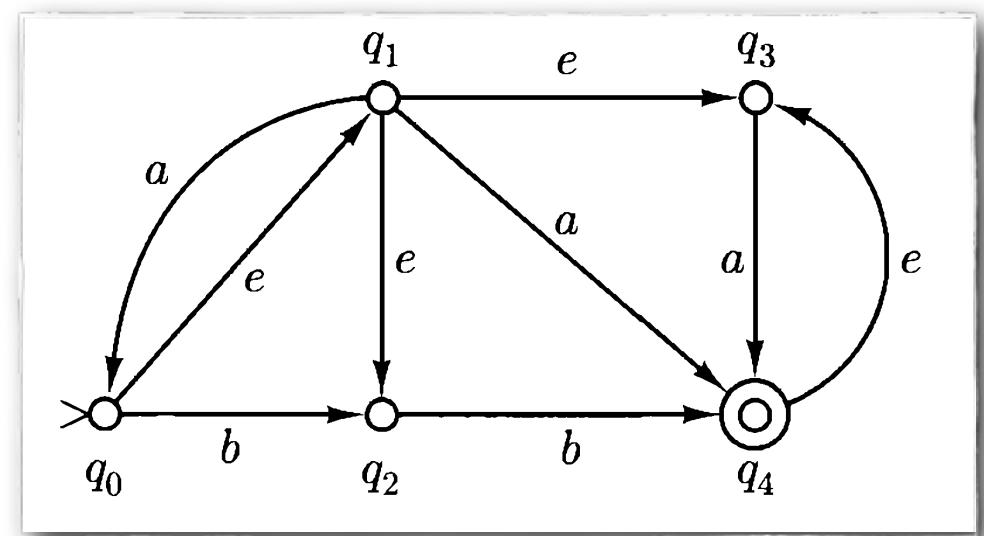

- $E(q) = \{ k \mid \langle q, \varepsilon \rangle \vdash^* \langle k, \varepsilon \rangle \}$

■ Examples:

- $E(q_0) = \{ q_0, q_1, q_2, q_3 \}$
- $E(q_1) = \{ q_1, q_2, q_3 \}$
- $E(q_2) = \{ q_2 \}$

■ Note:

- For all $q, q \in E(q)$

NFA = DFA

- **Theorem:** for every NFA $M = \langle K, \Sigma, \Delta, s, F \rangle$ there is an equivalent DFA M' such that $L(M) = L(M')$
- We construct the DFA $M' = \langle K', \Sigma, \delta', s', F' \rangle$ as follows:
 - $K' = 2^K$
 - $s' = E(s)$
 - $\delta'(Q, a) = \cup \{ E(k) \in K \mid \langle q, a, k \rangle \in \Delta \text{ for some } q \in Q \},$
 - for all $Q \subseteq K$
 - $F' = \{ Q \subseteq K \mid Q \cap F \neq \emptyset \}$

NFA = DFA

- **Lemma:** For any string $w \in \Sigma^*$ and any states $p, q \in K'$:
 - $\langle q, w \rangle \vdash_{M'}^* \langle p, \varepsilon \rangle$ iff $\langle E(q), w \rangle \vdash_{M'}^* \langle P, \varepsilon \rangle$ for some P containing p
- Using this lemma, it is easy to show that $L(M) = L(M')$
 - $w \in L(M)$
 - iff $\langle s, w \rangle \vdash_M^* \langle f, \varepsilon \rangle$, for some $f \in F$
 - iff $\langle E(s), w \rangle \vdash_{M'}^* \langle Q, \varepsilon \rangle$, for some Q containing f
 - iff $\langle E(s), w \rangle \vdash_{M'}^* \langle Q, \varepsilon \rangle$, for some $Q \in F'$
 - iff $w \in L(M')$

Subset construction algorithm

- **ϵ -closure(s)**

returns the set of NFA states reachable from state s using ϵ -transitions

- **ϵ -closure(T)**

returns the set of NFA states reachable from some s in T using ϵ -transition

- **move(T, a)**

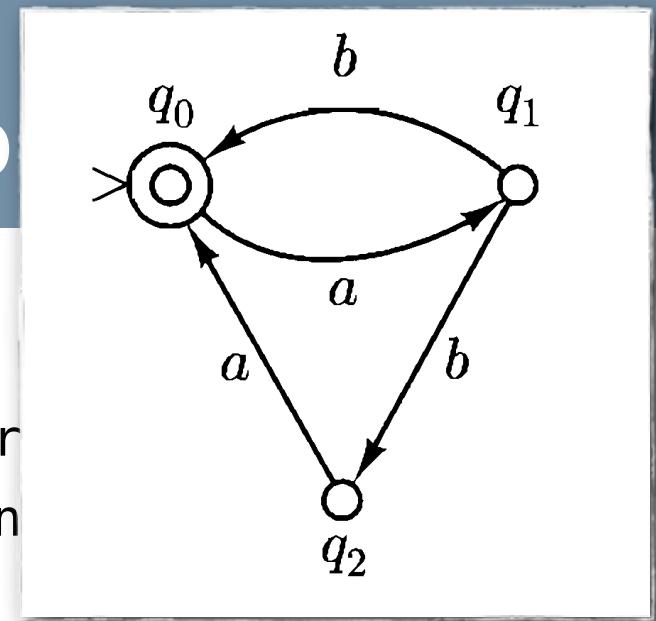

returns the set of NFA states to which there is transition for input $a \in \Sigma$ from some state $s \in T$

Subset construction algorithm

Exercise 1

- Apply (using pen and paper) the recognition algorithm on slide 16 for the nondeterministic automaton shown below to the input string “abaaba”
- There is a problem with this algorithm. Which one? How can the algorithm be improved?

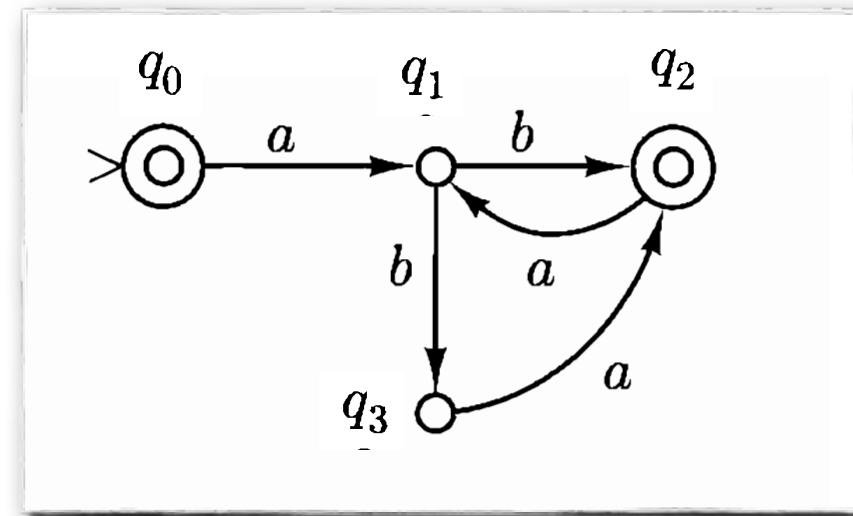

Exercise 2

- Construct a deterministic automaton for the nondeterministic automaton shown below, using the subset construction algorithm on slide 23.

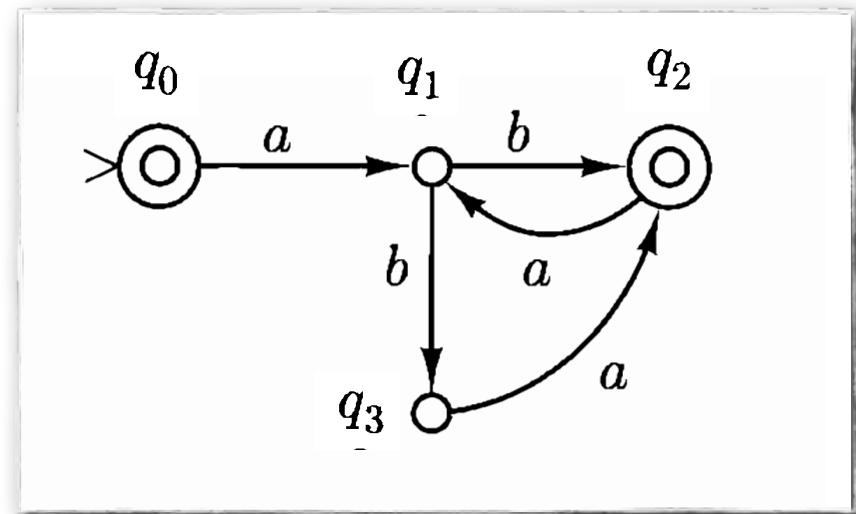

Exercise 3

- Implement the recognition algorithm for NFA on slide 16.
- Your submission should use the automaton shown below and the following inputs as test case.
 - $ab \in L(M)$
 - $aba \in L(M)$
 - $abaab \in L(M)$
 - $abba \notin L(M)$
 - $aabab \notin L(M)$
 - More test cases are welcome!

Exercise 4

- Implement the subset construction algorithm on slide 23.
- Your submission should use the automaton show below as a test case.

Exercises - Remarks

- Submit the source code by email to me (stth@...)
- The source code should contain a comment that tells **how to run your code.**
