**Q: HOW DO PEOPLE REACT TO ROBOT GAZE IN REAL TIME?**

SUBQUESTION:

- 1** if the gaze is odd (random), do people pay more attention to the robot, or behave differently vs normal gaze or people?

# METHOD

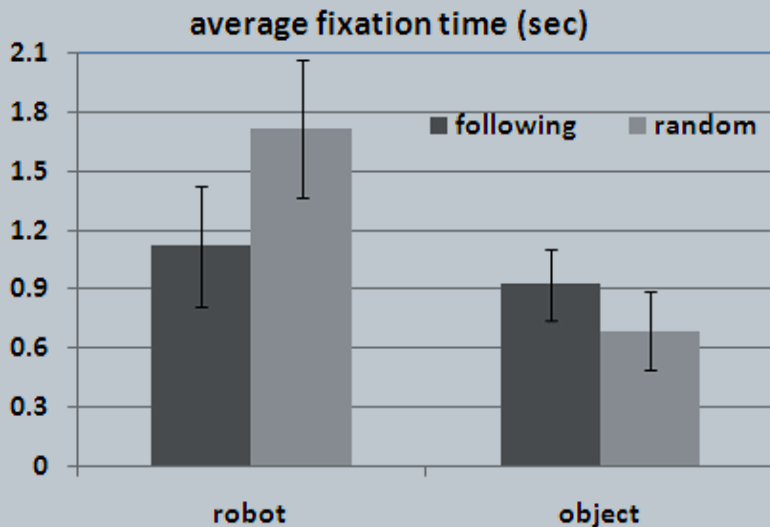

- ▶ word learning task:
  - ▶ p's "teach" the robot the names of colored objects
  - ▶ no restriction on approach and no instruction given
- ▶ p's eye tracked with a head-mounted eye tracker
- ▶ robot head can move and either:
  - `following` looks at whatever the p is looking at
  - `random` looks around randomly without regard for the p
- ▶ robot never moves arms or eyes nor does it ever speak

# RESULTS

## EYE-MOVEMENT DATA

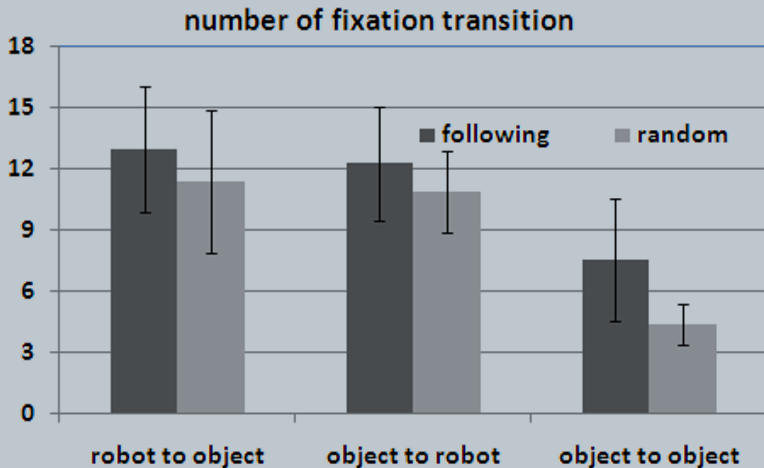

- ▶ longer fixations to the robot

# RESULTS

## EYE-MOVEMENT DATA

- ▶ fewer object-to-object transitions

## SPEECH ACTS

- ▶ same number of different words (types)
- ▶ but more words spoken (tokens)\*\*
- ▶ mostly more attention-attracting words (“look”, “see”, “hey!”, “here”) as well as object-naming words

\*  $p < 0.01$ ; \*\*  $p < 0.001$

## SPEECH ACTS

- ▶ same number of different words (types)
- ▶ but more words spoken (tokens)\*\*
- ▶ mostly more attention-attracting words (“look”, “see”, “hey!”, “here”) as well as object-naming words
- ▶ same number of utterances
- ▶ but longer utterances\*, more\*\* and longer naming utterances

\*  $p < 0.01$ ; \*\*  $p < 0.001$

## TEMPORAL DYNAMICS: LOOKS DURING NAMING EVENTS

- ▶ in “random” condition, looks to robot dominate at all times during naming
- ▶ in human-human naming, looks to target object increase early
  - ▶ this happens in “following” condition
  - ▶ but not during “random” condition

**following****random**

## (THEIR) CONCLUSION

- 1 people pay more attention to robots (and therefore less attention to the task) if the robot behaves abnormally
- 2 people exhibit normal j.a. behavior if robots follow gaze, but “unnatural” behavior if they don’t

## (OUR) DISCUSSION

- ▶ based on (?appearance/?task) the p's attempted to establish j.a. *even when the robot showed absolutely no indication of having attention/understanding*
- ▶ p's were frustrated (“hey!”, “look”) when the robot betrayed normal gaze conventions

# (OUR) DISCUSSION

“CAN PHENOMENA LIKE JOINT ATTENTION APPEAR IN HRI?”

- ▶ j.a.b. are communication
- ▶ but they're artifacts of being human
  - ▶ e.g. gaze works because of how our eyes work; we don't have real nose-gaze or ear-gaze

# (OUR) DISCUSSION

“CAN PHENOMENA LIKE JOINT ATTENTION APPEAR IN HRI?”

- ▶ j.a.b. are communication
- ▶ but they're artifacts of being human
  - ▶ e.g. gaze works because of how our eyes work; we don't have real nose-gaze or ear-gaze
- ▶ robots don't have attention?
- ▶ should robots behave like they have attention?
  - ▶ are j.a. functions helpful in h.r.i?
  - ▶ is it helpful for a robot to speak English in h.r.i?

THANKS!
