2008-05-06

Last Week: Type Theory

- Expressive limits of first-order logic (FOL)
 - *John is a blond / good / alleged thief*
 - *Mary has all properties of a good student*
- Solution: Generalise FOL to Type Theory
 - basic types: e, t
 - functional types $\langle \sigma, \tau \rangle$
 - build logic from functional application and the usual logical connectives (over higher-order constants and variables).

Type Theory – Syntax

- The sets of **well-formed expressions** WE_τ for every type τ are given by:
 - $CON_\tau \subseteq WE_\tau$, for every type τ
 - If α is in $WE_{(\sigma, \tau)}$, β in WE_σ , then $\alpha(\beta) \in WE_\tau$.
 - If A, B are in WE_t , then $\neg A, (A \wedge B), (A \vee B), (A \rightarrow B), (A \leftrightarrow B)$ are in WE_t .
 - If A is in WE_t , then $\forall vA$ and $\exists vA$ are in WE_t , where v is a variable of arbitrary type.
 - If α, β are well-formed expressions of the same type, then $\alpha = \beta \in WE_t$.

3

Building well-formed expressions

- John is a good student*

- A student works*

4

Type Theory – Semantics [1/3]

- Let U be a non-empty set of entities.
- The **domain of possible denotations** D_τ for every type τ is given by:
 - (1) $D_e = U$
 - (2) $D_t = \{0,1\}$
 - (3) $D_{(\sigma, \tau)}$ is the set of all functions from D_σ to D_τ

Type Theory – Semantics [2/3]

- A **model structure** for a type theoretic language consists of a pair $M = (U, V)$, where
 - U (or U_M) is a non-empty domain of individuals
 - V (or V_M) is an interpretation function, which assigns to every member of CON_τ an element of D_τ .
- **Variable assignment** g assigns every variable of type τ a member of D_τ .

Type Theory – Semantics [3/3]

- Interpretation with respect to model structure M and variable assignment g :

$$\llbracket \alpha \rrbracket^{M,g} = V_M(\alpha), \text{ if } \alpha \text{ constant}$$

$$\llbracket \alpha \rrbracket^{M,g} = g(\alpha), \text{ if } \alpha \text{ variable}$$

$$\llbracket \alpha(\beta) \rrbracket^{M,g} = \llbracket \alpha \rrbracket^{M,g}(\llbracket \beta \rrbracket^{M,g})$$

$$\llbracket \neg \phi \rrbracket^{M,g} = 1 \text{ iff } \llbracket \phi \rrbracket^{M,g} = 0$$

$$\llbracket \phi \wedge \psi \rrbracket^{M,g} = 1 \text{ iff } \llbracket \phi \rrbracket^{M,g} = 1 \text{ and } \llbracket \psi \rrbracket^{M,g} = 1, \text{ etc.}$$

$$\llbracket \alpha = \beta \rrbracket^{M,g} = 1 \text{ iff } \llbracket \alpha \rrbracket^{M,g} = \llbracket \beta \rrbracket^{M,g}$$

- if $v \in \text{VAR}_\tau$:

$$\llbracket \exists v \phi \rrbracket^{M,g} = 1 \text{ iff there is } d \in D_\tau \text{ such that } \llbracket \phi \rrbracket^{M,g[v/d]} = 1$$

$$\llbracket \forall v \phi \rrbracket^{M,g} = 1 \text{ iff for all } d \in D_\tau : \llbracket \phi \rrbracket^{M,g[v/d]} = 1$$

Today: Semantics Construction

- Elementary semantics construction:
 - the principle of compositionality
 - compositional semantics construction using type theory
- Quantified noun phrases
- The lambda operator in type theory

The Principle of Compositionality

- The meaning of a complex expression is uniquely determined by the meanings of its sub-expressions and the syntactic rules by which they are combined.
- (The principle is also called “Frege’s principle”)

Two Levels of Interpretation

- Semantic interpretation is a two-step process
 - Natural language (NL) expressions are assigned a semantic representation (logical formulas).
 - The semantic representation is truth-conditionally interpreted.
- Truth-conditional interpretation of logical representations is strictly compositional.
- We also want this for the process of computing logical representations from NL expressions.

Compositional Semantics Construction

- Basic idea: we start with a syntactic analysis of an NL expression, and
- assign each syntactic node in the syntax tree a semantic representation
- by combining the representations of its daughter nodes.

11

Basic Composition Rules

- Rule of functional application

$$\frac{B \Rightarrow \beta : \langle \sigma, \tau \rangle \quad C \Rightarrow \gamma : \sigma}{A \Rightarrow \beta(\gamma) : \tau} \quad \text{or} \quad \frac{B \Rightarrow \beta : \sigma \quad C \Rightarrow \gamma : \langle \sigma, \tau \rangle}{A \Rightarrow \gamma(\beta) : \tau}$$

- Rule for non-branching nodes

$$\frac{B \Rightarrow \beta : \tau}{A \Rightarrow \beta : \tau}$$

12

Basic Composition Rules

- Rule for lexical nodes:

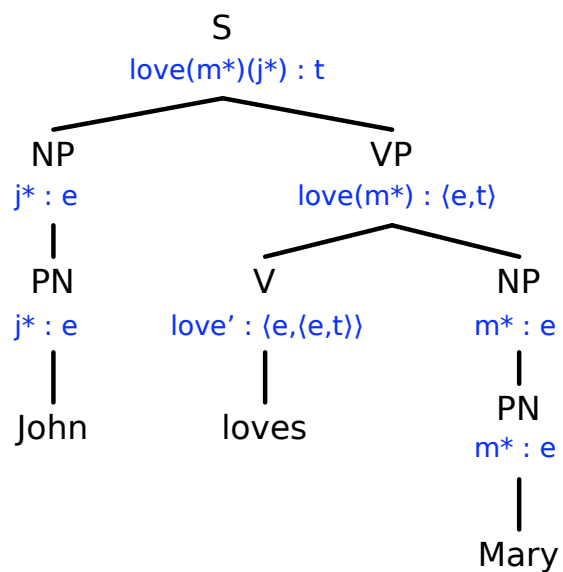

$$\frac{}{A \Rightarrow \beta : \tau}$$

A
|
w

- The semantic representation β for a word w is supplied by the lexicon.

13

An Example

14

Noun phrases and compositionality

John works \Rightarrow $\text{work}'(j^*)$

Somebody works $\Rightarrow \exists x(\text{work}'(x))$

Every student works $\Rightarrow \forall x(\text{student}'(x) \rightarrow \text{work}'(x))$

No student works $\Rightarrow \neg \exists x(\text{student}'(x) \wedge \text{work}'(x))$

John and Mary work $\Rightarrow \text{work}'(j^*) \wedge \text{work}(m^*)$

- What's the semantic representation of a noun phrase?

15

Towards a unified semantics of Noun Phrases

- *John works*

$$\frac{j^* : e \quad \text{work}' : \langle e, t \rangle}{\text{work}'(j^*) : t}$$

- *Every student works*

$$\frac{\text{every-student}' : \langle \langle e, t \rangle, t \rangle \quad \text{work}' : \langle e, t \rangle}{\text{every-student}'(\text{work}') : t}$$

16

Towards a unified semantics of Noun Phrases

- *John works*

$$\frac{\text{john}' : \langle \langle e,t \rangle, t \rangle \quad \text{work}' : \langle e,t \rangle}{\text{john}'(\text{work}') : t}$$

- *Every student works*

$$\frac{\text{every-student}' : \langle \langle e,t \rangle, t \rangle \quad \text{work}' : \langle e,t \rangle}{\text{every-student}'(\text{work}') : t}$$

17

A Coverage Problem

- *Swimming is healthy*

$$\frac{\text{swim}' : \langle e,t \rangle \quad \text{healthy}' : \langle \langle e,t \rangle, t \rangle}{\text{healthy}'(\text{swim}') : t}$$

- *Not smoking is healthy*
- *Drinking and driving is dangerous*

18

Summing up

- We have the following kinds of problems:
 - We want uniform semantic representations for noun phrases, and we don't seem to have the syntax to write them down.
 - Some natural language expressions seem to require us to say “an x with property P .”
- Solution: λ -abstraction

19

λ -Abstraction

- Syntax:
 - If $\alpha \in WE_\tau$ and $v \in VAR_\sigma$, then $\lambda v \alpha \in WE_{(\sigma, \tau)}$.
- Example:
 - $\lambda x(\text{drive}(x) \wedge \text{drink}(x))$
- Notational conventions:
 - The scope of the λ -operator is the smallest WE to its right.
 - Wider scope must be indicated by brackets.
 - We often use the “dot notation” $\lambda x. \dots$ indicating that the λ -operator takes widest possible scope.

20

λ -Abstraction

- $\lambda x[\text{drive}(x) \wedge \text{drink}(x)]$
- ... a term of type $\langle e, t \rangle$
- ... denotes the property of being “an x such that x drives and drinks”
- λ -abstraction is an operation that takes an expression and “opens” a specific argument positions. The result of abstraction over individual variable x in the formula $\text{drive}(x) \wedge \text{drink}(x)$ results in the complex predicate $\lambda x[\text{drive}(x) \wedge \text{drink}(x)]$.

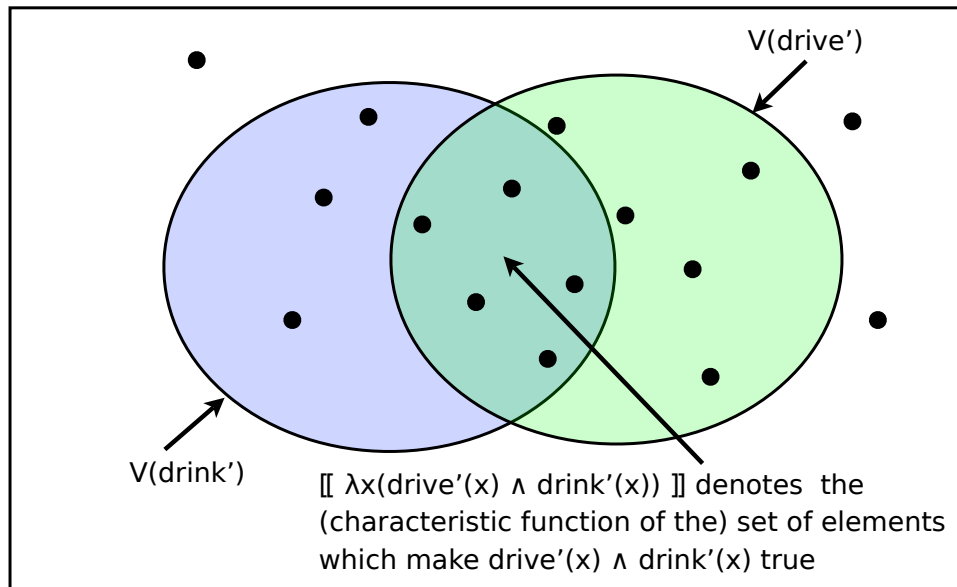

21

λ -Abstraction: Semantics

- $\llbracket \lambda v \alpha \rrbracket^{M,g}$ is that function $f : D_\sigma \rightarrow D_\tau$ such that for all $a \in D_\sigma$, $f(a) = \llbracket \alpha \rrbracket^{M,g[v/a]}$ (for $\alpha \in WE_\tau$, $v \in VAR_\sigma$)
- Notice that of course $f \in D_{(\sigma,\tau)}$.
- In general:
$$\llbracket (\lambda v \alpha)(\beta) \rrbracket^{M,g} = \llbracket \alpha \rrbracket^{M,g[v / \llbracket \beta \rrbracket^{M,g}]}$$

22

$$\lambda x(\text{drive}'(x) \wedge \text{drink}'(x))$$

23

Back to the Coverage Problem

- *Not smoking is healthy*
 - $\text{healthy}(\lambda x. \neg \text{smoke}(x))$
- *Drinking and driving is unwise*
 - $\neg \text{wise}(\lambda x. \text{drink}(x) \wedge \text{drive}(x))$

24

β -Reduction

- By the modified variable assignment, the value of the argument of the λ -expression is passed through its body and becomes the value of all occurrences of variables bound by the λ -operator.
- We obtain the same result, if we first substitute the free occurrences of the λ -variable in $\lambda v\alpha(\beta)$ by the argument β , and only then interpret the result:
 - $\llbracket \lambda v\alpha(\beta) \rrbracket^{M,g} = \llbracket \alpha \rrbracket^{M,g[v/\llbracket \beta \rrbracket^{M,g}]} \text{ to}$
 - $\llbracket \lambda v\alpha(\beta) \rrbracket^{M,g} = \llbracket [\beta/v]\alpha \rrbracket^{M,g}$
- This is the basic idea behind the λ -calculus.

25

Variable capturing

- Are $\lambda v\alpha(\beta)$ and $[\beta/v]\alpha$ always equivalent?
 - $\lambda x[\text{drive}'(x) \wedge \text{drink}'(x)](j^*) \Rightarrow \text{drive}'(j^*) \wedge \text{drink}'(j^*)$
 - $\lambda x[\text{drive}'(x) \wedge \text{drink}'(x)](y) \Rightarrow \text{drive}'(y) \wedge \text{drink}'(y)$
 - $\lambda x[\forall y \text{ know}'(x)(y)](j^*) \Rightarrow \forall y \text{ know}(j^*)(y)$
 - $\lambda x[\forall y \text{ know}'(x)(y)](y) \not\Rightarrow \forall y \text{ know}(y)(y)$
- Let v, v' be variables of the same type, α any well-formed expression. v is free for v' in α iff no free occurrence of v' in α is in the scope of a quantifier or a λ -operator that binds v .

26

Conversion rules in the λ -calculus

- **β -conversion:**
 $\lambda v \alpha(\beta) \Leftrightarrow [\beta/v] \alpha$ if all free variables in β are free for v in α .
- **α -conversion:**
 $\lambda v \alpha \Leftrightarrow \lambda v' [v'/v] \alpha$ if v' is free for v in α .
- **η -conversion:**
 $\lambda v (\alpha(v)) \Leftrightarrow \alpha$
- The rule which we will use most in semantics construction is β -conversion in the left-to-right direction (**β -reduction**), which allows us to simplify representations.

27

An Example

- *John drives and drinks.*

$$\begin{array}{c}
 \frac{\text{drive}' : \langle e, t \rangle \quad x : e}{\text{drive}'(x) : t} \quad \frac{\text{drink}' : \langle e, t \rangle \quad x : e}{\text{drink}'(x) : t} \\
 \hline
 \text{drive}'(x) \wedge \text{drink}'(x) : t \\
 \hline
 \lambda x (\text{drive}'(x) \wedge \text{drink}'(x)) : \langle e, t \rangle \quad j^* : e \\
 \hline
 \lambda x (\text{drive}'(x) \wedge \text{drink}'(x)) (j^*) \\
 \Rightarrow_{\beta} \text{drive}'(j^*) \wedge \text{drink}'(j^*)
 \end{array}$$

28

Back to Noun Phrases

- We were looking for a uniform representation for noun phrases:
 - All noun phrases are uniformly represented as terms of type $\langle\langle e,t\rangle,t\rangle$ i.e., expressions that denote sets of first-order properties (type $\langle e,t\rangle$).
 - Interpretation of “John:” the set of properties P such that John has property P .
 - Interpretation of “every student:” the set of properties P such that every student has P .
 - and so on ...

29

Back to Noun Phrases

- Interpretation of “John:” the set of properties P such that John has property P :
 - $\lambda P(P(j^*))$
- Interpretation of “every student:” P belongs to the set if every student has property P :
 - $\lambda P(\forall x(\text{student}'(x) \rightarrow P(x)))$
- Interpretation of “a student:” P belongs to the set if a student has property P :
 - $\lambda P(\exists x(\text{student}'(x) \wedge P(x)))$

30

More Noun Phrases

John $\Rightarrow \lambda G(G(j^*))$

Somebody $\Rightarrow \lambda G \exists x G(x)$

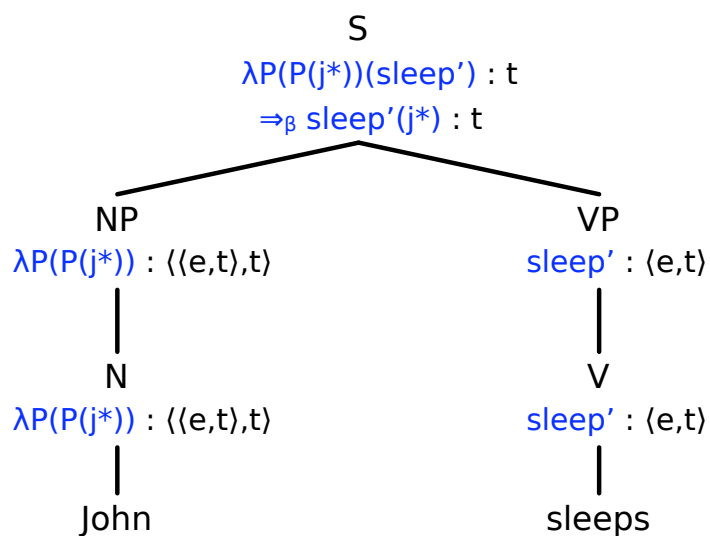

A student $\Rightarrow \lambda G \exists x(\text{student}(x) \wedge G(x))$

No student $\Rightarrow \lambda G \neg \exists x(\text{student}(x) \wedge G(x))$

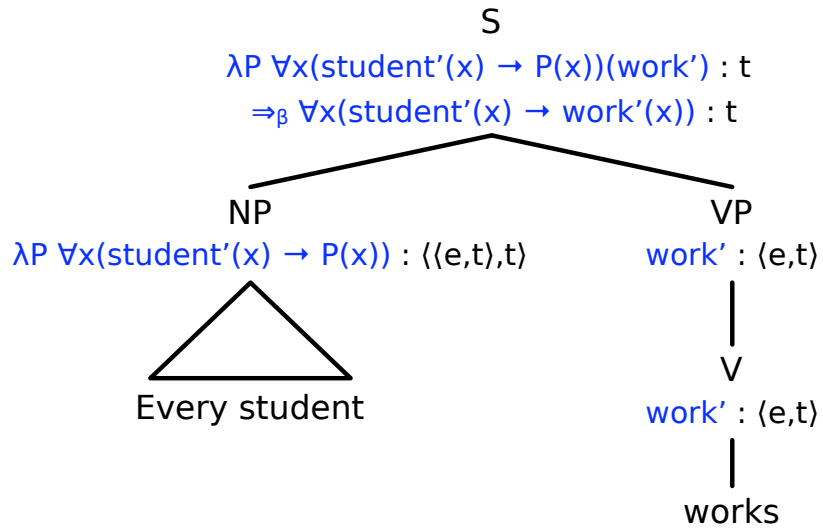

John $\Rightarrow \lambda G(G(j^*))$

John and Mary $\Rightarrow \lambda G(G(j^*) \wedge G(m^*))$

“John sleeps”

“Every student works”

33

Determiners

a, some $\Rightarrow \lambda F \lambda G \exists x(F(x) \wedge G(x))$

every $\Rightarrow \lambda F \lambda G \forall x(F(x) \rightarrow G(x))$

no $\Rightarrow \lambda F \lambda G \neg \exists x(F(x) \wedge G(x))$

most $\Rightarrow \text{most}'$ (a constant)

34

“Every student works.”
