A glimpse of the new MaryTTS architecture

During the last years, we have redesigned intensively the core of MaryTTS in order to make it extensible and easier to user. The goal of this presentation is to introduce the key points of the new architecture. First, I will present how the data is represented in the system and why this is more flexible than the previous XML representation. Then I will develop the new module architecture logic and explain why this new logic is a new step to make the system more adapted to easy prototyping and research properties.
