

Computational Psycholinguistics

Lecture 2: Parsing Mechanisms

Matthew W. Crocker

Marty Mayberry

Human Language Processing

- We understand language incrementally, word-by-word
 - How do people construct interpretations
- We must resolve local and global ambiguity
 - How do people decide upon a particular interpretation
- Decisions are sometimes wrong!
 - What information is used to identify we made a mistake
 - How do we search for an alternative
- Answers can reveal important details about the underlying mechanisms

Experimental Methods

Reading times

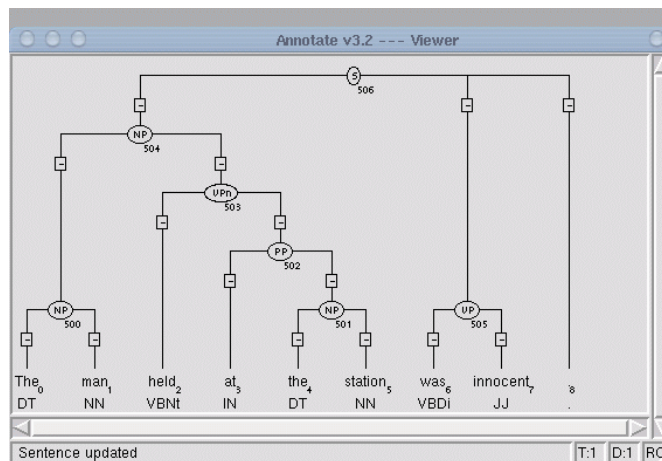

Neuroscientific methods

Situated spoken sentence comprehension

The Problem

🍷 How do people recover the meaning of an utterance in real-time?

"The man held at the station was innocent"

Reading time studies

- We can use controlled experiments of reading times to investigate local ambiguity resolution
- (a) The man held at the station was innocent (LA)
- (b) The man who was held at the station was innocent (UA)
- Compare the reading times of (b) where there is no ambiguity, with (a) to see if and when the ambiguity causes reading difficulty.
 - Need a “linking hypothesis” from theory to measures
 - Can then manipulate other linguistic factors to determine their influence on on RTs in a controlled manner

Reading Methods

- Whole sentence reading times:

The man held at the station was innocent

- Self-paced reading, central presentation:

is the ~~held~~ ~~at~~ ~~the~~ ~~station~~

- Self-paced reading, moving window:

~~The man held at the station~~ was innocent

Eye-tracking: Difference Measures

The man held at the station was innocent

Eye-tracking: First Fixation

The man held at the station was innocent

Eye-tracking: First Pass

The man held at the station was innocent

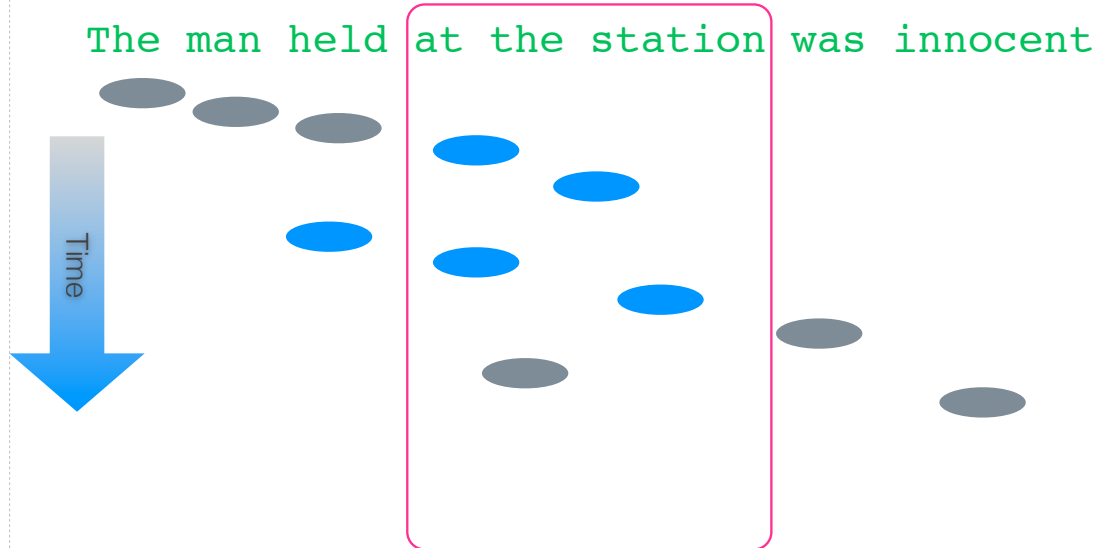

Eye-tracking: Total time

The man held at the station was innocent

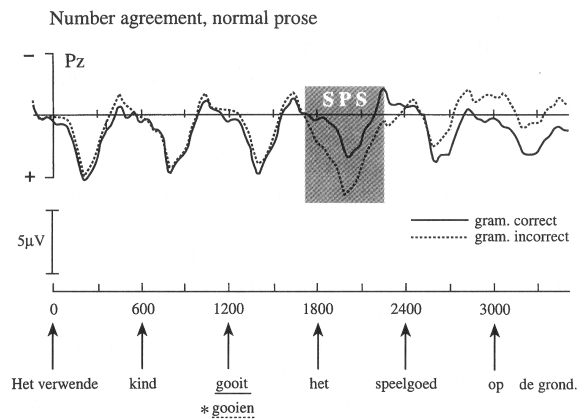

Eye-tracking: Regression Path

Neuroscientific Measures: ERPs

🍷 Syntactic and semantic processes are partially revealed by signature patterns in EEGs: Event-Related Potentials (ERPs)

🍷 Syntactic Anomaly: P600 or SPS

"The spoilt child throw(s) the toy on the ground"

Semantic Anomaly: N400

'They wanted to make the hotel look more like a tropical resort.
So along the driveway they planted rows of ...'

central

trends in Cognitive Sciences

Spoken comprehension in visual

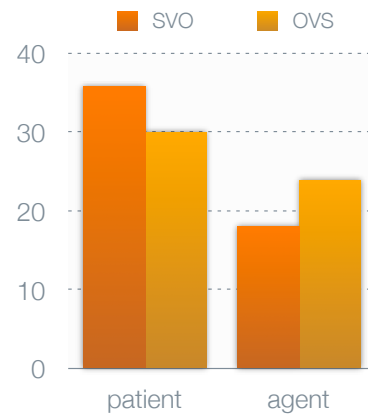

Monitor gaze in the scene as people hear a spoken utterance

Listeners fixate objects which are mentioned (180ms)

Anticipatory eye-movements reflect interpretation

Anticipation in Visual Worlds

SVO: *Der Hase frisst gleich **den Kohl***
 "The rabbit eats soon the cabbage"

OVS: *Den Hasen frisst gleich **der Fuchs***
 "The rabbit is eaten soon by the fox"

Kamide, Scheepers & Altmann, *JPR*, 2003

Summary

- ❁ People construct an interpretations, word-by-word
 - ❁ People must resolve ambiguity
 - ❁ Sometimes we must revise our interpretation of the sentence so far
- ❁ On-line measures can tell us about how/when this occurs
 - ❁ Reading times, ERPs, gaze in visual scene
- ❁ We can design experiments which exploit these methods (and others!) to investigate the underlying processing architectures and mechanisms

Linking Hypotheses

- Reading times: relative processing difficulty
 - correlated with processing complexity and reanalysis
- Visual attention: reference and anticipation
 - correlated with interpretation and inference
- N-400: semantic anomaly
 - correlated with semantic integration
- P-600/SPS: syntactic anomaly
 - correlated with disambiguation and reanalysis

Parsing Mechanisms

- Syntactic processing requires a solution to the problem of:
 - How structures are incrementally constructed
 - How local and global ambiguity
- Incremental Parsing
 - Top-down; Bottom-up; Mixed strategies
- Ambiguity and parsing:
 - Serial (deterministic/non-deterministic)
 - Parallel (bounded/unbounded)

Context Free Grammars

Context-free grammar rules:

- | | |
|------------------------|-----------------------------|
| $S \rightarrow NP VP$ | $Det \rightarrow the$ |
| $PP \rightarrow P NP$ | $Det \rightarrow every$ |
| $VP \rightarrow V NP$ | $N \rightarrow man, woman$ |
| $VP \rightarrow V$ | $N \rightarrow book$ |
| $NP \rightarrow NP PP$ | $P \rightarrow with$ |
| $NP \rightarrow Det N$ | $V \rightarrow read, reads$ |

Node admissibility criterion:

- A tree is admitted by the grammar, if for each non-terminal node, N, with daughters Ds, there is a rule in the grammar of the form: $N \rightarrow Ds$.

Simple example

Parsing Algorithms for PSGs

Algorithms to recover the parse tree for an utterance vary ...

- left-to-right, head-driven, right to left
- top-down, bottom-up, mixed
- deterministic, serial, parallel

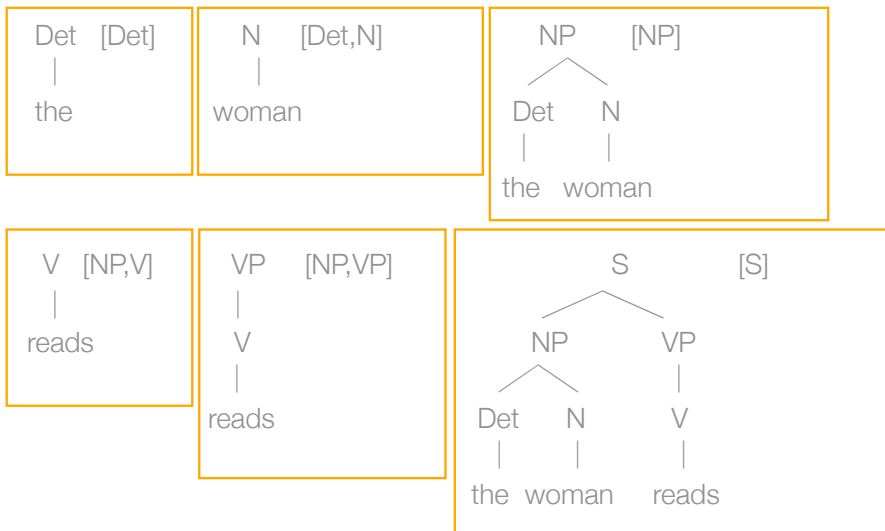

Processing complexity:

- Time: what time is required to parse a sentence as a function of sentence length, grammar size?
- Space: how much memory does the parser require?

Bottom-up Parsing

“The woman reads”

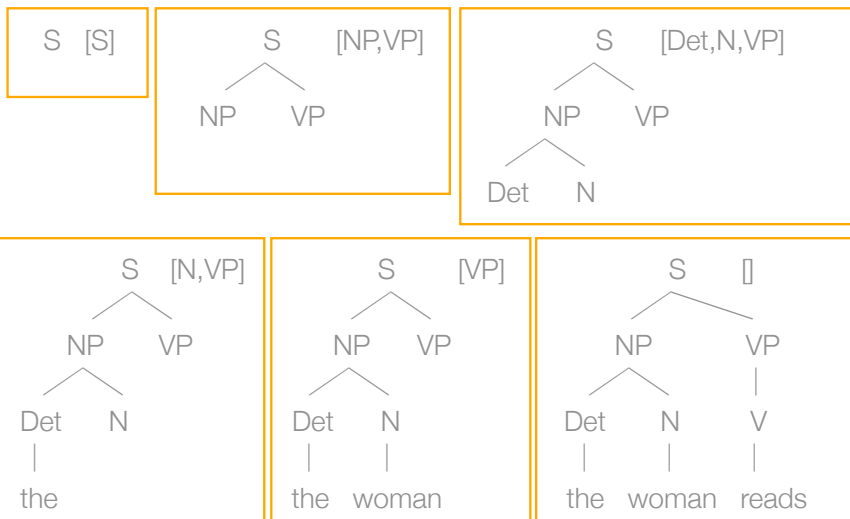

Shift-reduce Algorithm

- 1 Initialise *Stack* = []
- 2 loop: Either *shift*:
 - Determine category, *C*, for next word in sentence;
 - Push *C* onto the stack;
- 3 Or *reduce*:
 - If categories on the *Stack* match the RHS of a rule:
 - Remove those categories from the *Stack*;
 - Push the LHS category onto the *Stack*;
- 4 No more words to process?
 - If *Stack* = [*S*], then done;
- 5 Goto loop

Top-down Parsing

“The woman reads”

Top-down Algorithm

- ① Initialise *Stack* = [S]
- ② If top(*Stack*) is a non-terminal, *N*:
 - ☘ Select rule $N \rightarrow RHS$;
 - ☘ pop(*N*) off the stack and push(*RHS*) on the stack;
- ③ If top(*Stack*) is a pre-terminal, *P*:
 - ☘ Get next word, *W*, from the input;
 - ☘ If $P \rightarrow W$, then pop(*P*) from the stack;
 - ☘ Else fail;
- ④ No more words to process?
 - ☘ If *Stack* = [], then done;
- ⑤ Goto ②

Evaluating top-down & bottom-up

- ☘ Are these parsers psychologically plausible?
- ☘ Incrementality:
 - ☘ Bottom-up: no
 - ☘ Top-down: yes
- ☘ Input-driven:
 - ☘ Bottom-up: yes
 - ☘ Top-down: no + problems with left-recursion

A Psychologically Plausible Parser

- Left-Corner Parsing
- Rules are 'activated' by their 'left-corner'

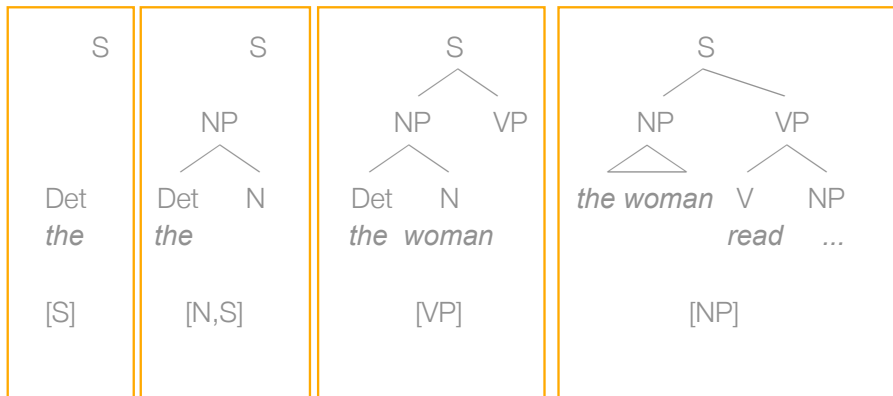

- Combines input-driven with top-down
- There is a 'class' of LC parsers

An example LC parse

"The woman read the book"

Is this incremental?

Evaluating the LC Parser

☘ Not necessarily incremental:

☘ Variations: Arc-standard versus arc-eager

☘ Affect on ambiguity resolution for arc-eager:

- ☘ Commitment to attachments is early, before daughters are completely built
- ☘ Top-down use of syntactic context and possible left-recursion problems

Incrementality and Memory

☘ It wasn't incrementality that led to the LC algorithm, but memory load:

- ☘ "The mouse died"
- ☘ "The mouse the cat chased died"
- ☘ "The mouse the cat the dog bit chased died"

(Or: "The mouse that the cat that the dog bit chased died")

☘ Grammatical, not ambiguous, what's the problem?

☘ Memory load: too high for centre embedding

- ☘ "[The mouse [the cat [the dog bit] chased] died]"

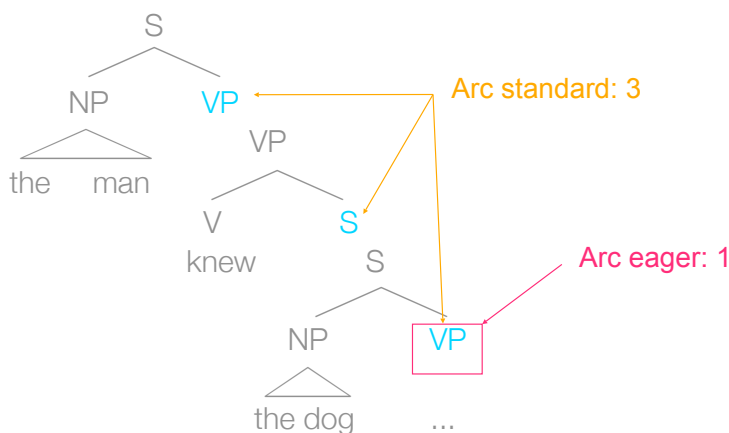

Memory Load in Parsing

- ☘ Left-embedding is easy: *[[[John's brother]'s car door]'s handle] broke off.*
- ☘ Right-embedding too: *John believes [Bill knows [Mary said [she likes cats]]]*
- ☘ Centre-embedding is hard: *[The mouse [the cat [the dog bit] chased] died]*
- ☘ Memory load for parsers:
 - ☘ Top-down: LE: hard CE: hard RE: easy
 - ☘ Bottom-up: LE: easy CE: hard RE: hard
 - ☘ Left-corner: LE: easy CE: hard RE: easy

Evaluating the LC Parser

- ☘ Variations: Arc-standard versus Arc-eager

Summary of Behaviour

Node	Arcs	Left	Centre	Right
Top-down	Either	$O(n)$	$O(n)$	$O(1)$
Shift-reduce	Either	$O(1)$	$O(n)$	$O(n)$
Left-corner	Standard	$O(1)$	$O(n)$	$O(n)$
Left-corner	Eager	$O(1)$	$O(n)$	$O(1)$
People		$O(1)$	$O(n)$	$O(1)$

Comments on Left-Corner

- ⦿ Mixed data-driven and hypothesis driven approaches
 - ⦿ Eager corresponds to composition of partial structures
- ⦿ Arc Standard: less ambiguity
 - ⦿ attach when constituents are complete: safer
 - ⦿ delayed attachment means more is kept on the stack
- ⦿ Arc Eager: less memory
 - ⦿ early composition reduces stack growth
 - ⦿ eager attachments are less bottom-up
