## Unification Grammar

A circular diagram containing semantic features for the NP node. The features are organized into four sections: PHON, SYN, VALENCE, and SEM. The PHON section contains "an old penny". The SYN section contains "NP" under "CAT", "objective" under "CASE", "sing" under "NUMBER", and "third" under "PERSON". The VALENCE section contains "vstruc". The SEM section contains "exist" under "QUANT", "X<sub>1</sub>" under "VAR", "old" under "REL", "X<sub>1</sub>" under "VAR", and "penny" under "ARG".

PHON	/an old penny/
SYN	CAT NP HEAD CASE objective NUMBER sing PERSON third
VALENCE	vstruc
SEM	QUANT exist VAR X <sub>1</sub> REL old VAR X <sub>1</sub> ARG penny

- How large is the grammar.
- Let's start with the lexicon.

## Estimates for English

- Shakespeare actively used 29.000 word forms mapping to about 25.000 head words
- common estimates of the vocabulary of a college graduate:  
20.000 words active -- 25.000 words passive
- David Crystal's estimate  
60.000 words active -- 75.000 words passive
- Total Size of English Vocabulary
  - 1 million words without special scientific and technical terms
  - 2 million words including all scientific and technical terms

A million-word-corpus of American English exhibits about 38.000 head words.

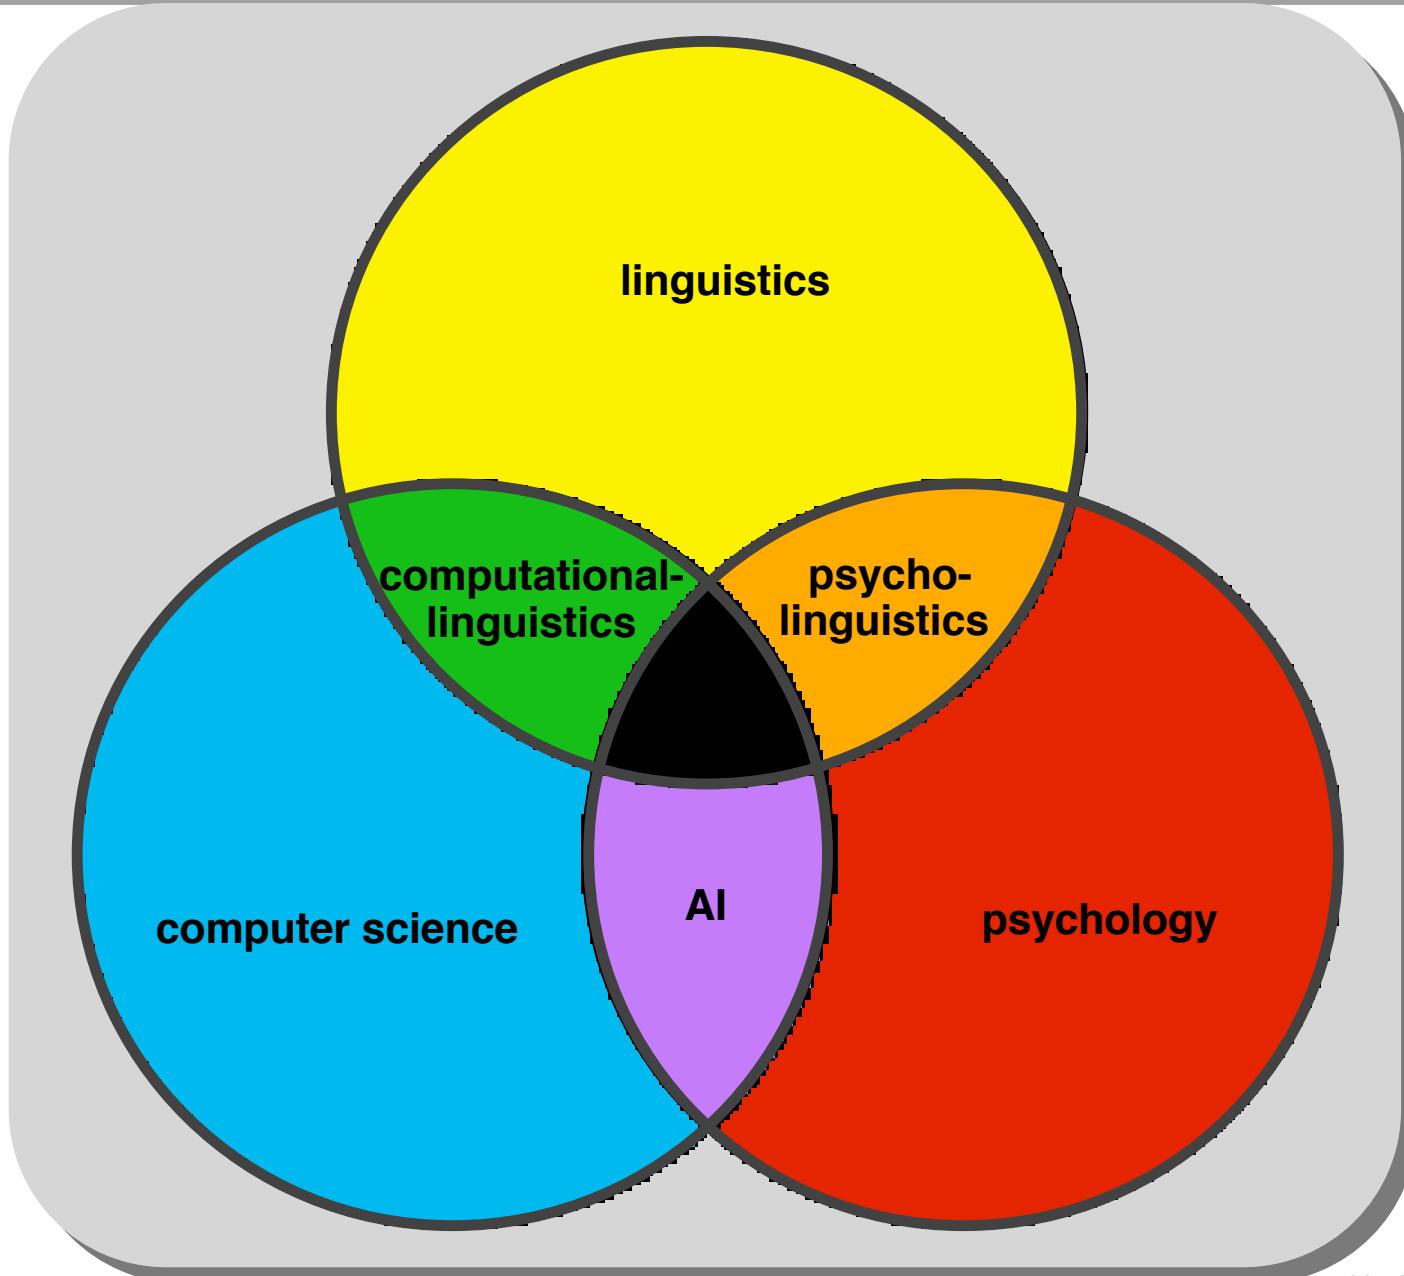

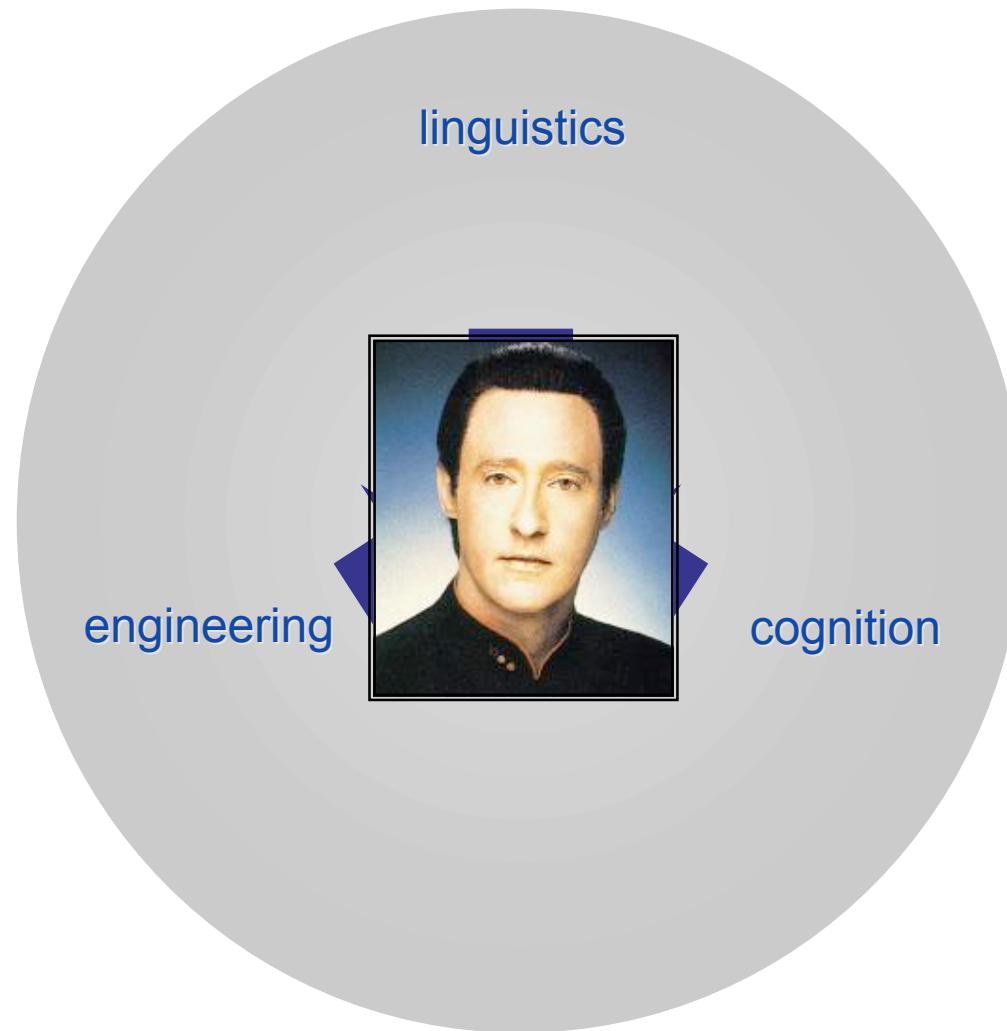

- LinGO - English Resource Grammar
  - (60% coverage of newspaper texts)
  - ◆ 8.000 types
  - ◆ 100.000 lines of code
  - ◆ average feature structure > 300 nodes

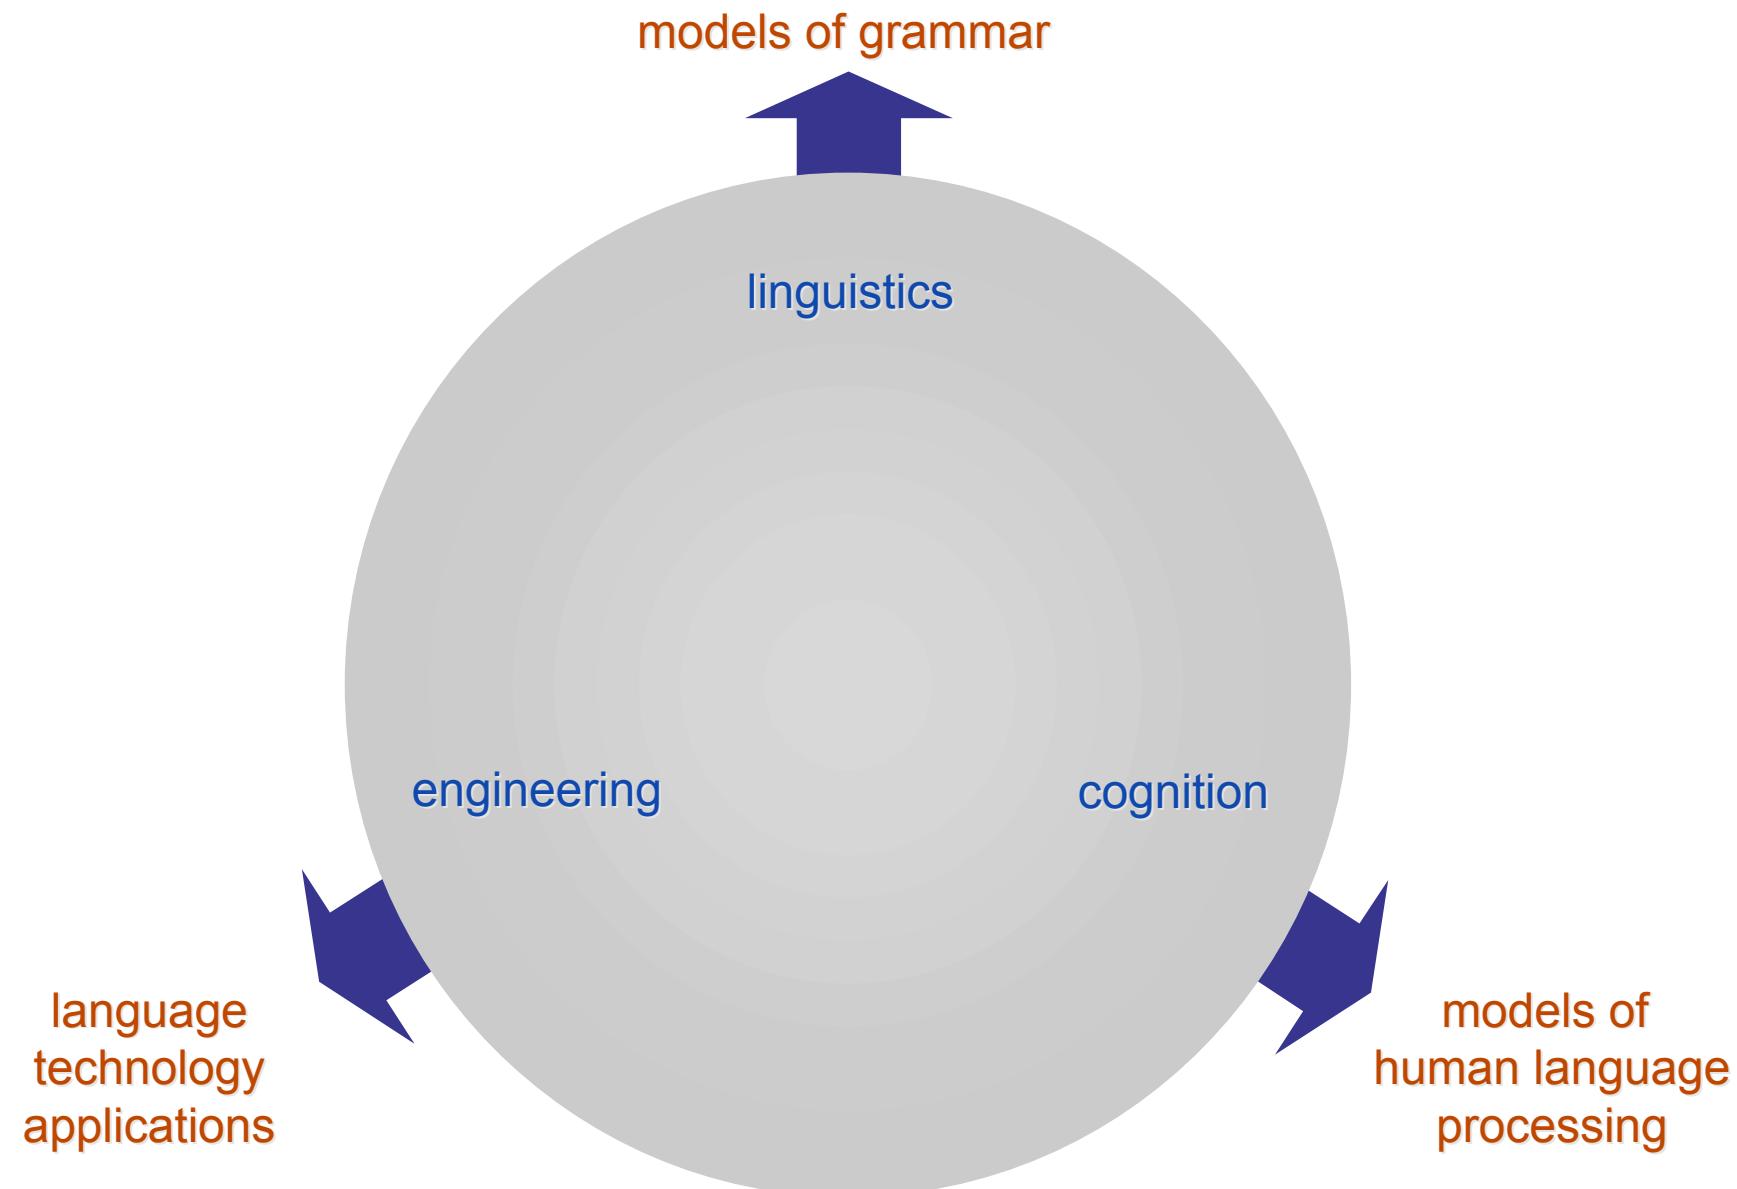

- According to Ethnologue 6,809 languages
- 230 in Europe, 2197 in Asia (832 in Papua-New Guinea)
- Bible translations exist for 2.200 languages
- 250 families of languages (such as Indoeuropean Languages)

- LINGUISTIC KNOWLEDGE

- What are the contents and structures of this knowledge

- LANGUAGE PROCESSING

- How do we produce and comprehend linguistic utterances?

- LANGUAGE ACQUISITION

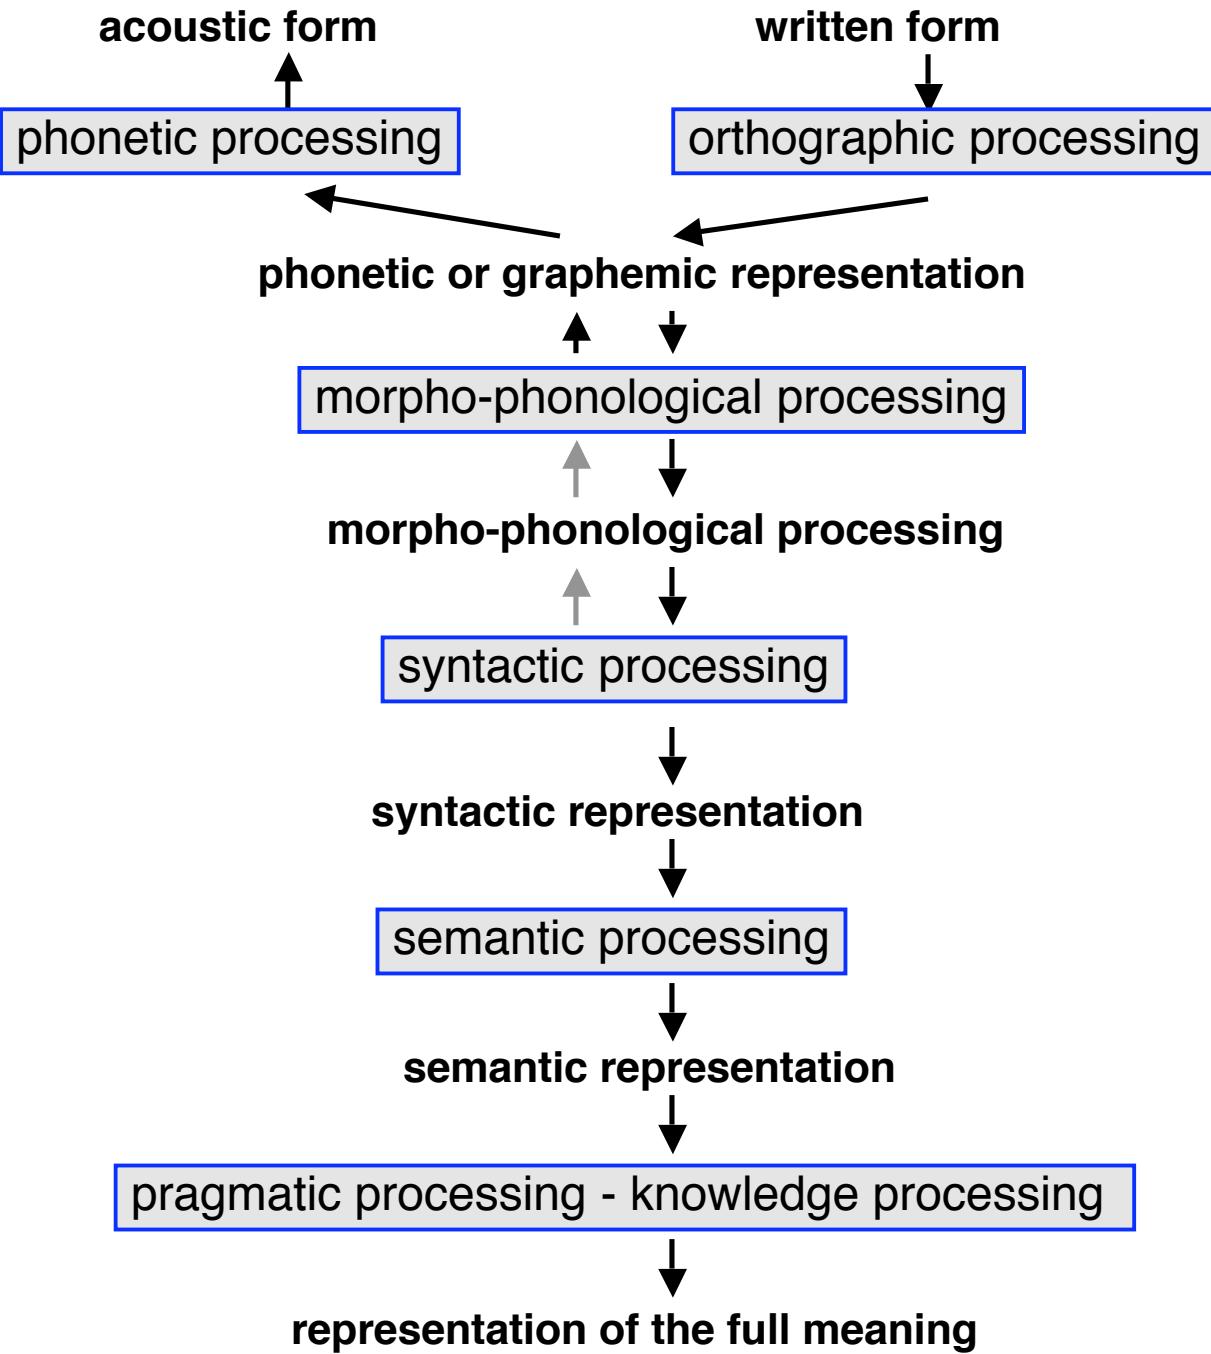

- How does the child learn his mother tongue?

- LANGUAGE CHANGE

- How do languages (dialects, sociolects) emerge, change, evolve?

# **Text-to-Speech System**

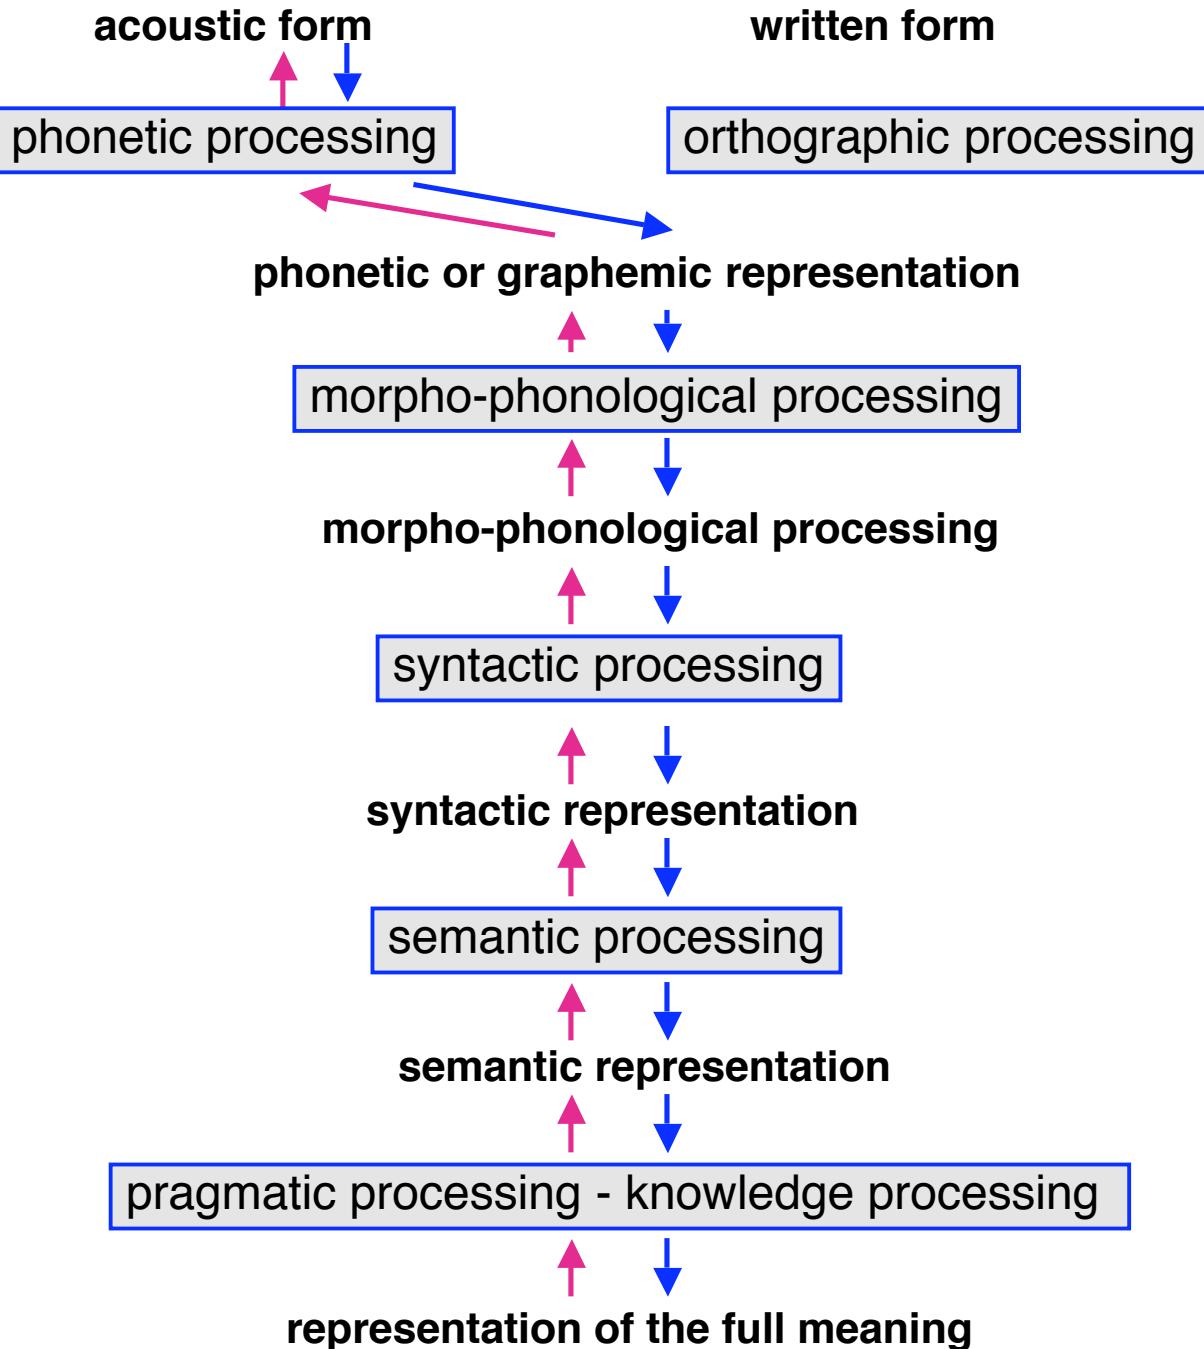

Why do we need deep processing for simple text-to-speech conversion

- (1) **The girls will read the paper.** (*reed*)
- (2) **The girls have read the paper.** (*red*)
- (3) **Will the girls read the paper?** (*reed*)
- (4) **Have any men of good will read the paper?** (*red*)
- (5) **Have the executors of the will read the paper?** (*red*)
- (6) **Have the girls who will arrive next week read the paper yet?** (*red*)
- (7) **Please have the girls read the paper.** (*reed*)
- (8) **Have the girls read the paper?** (*red*)

# Speech Translation

If you can walk  
you can dance.

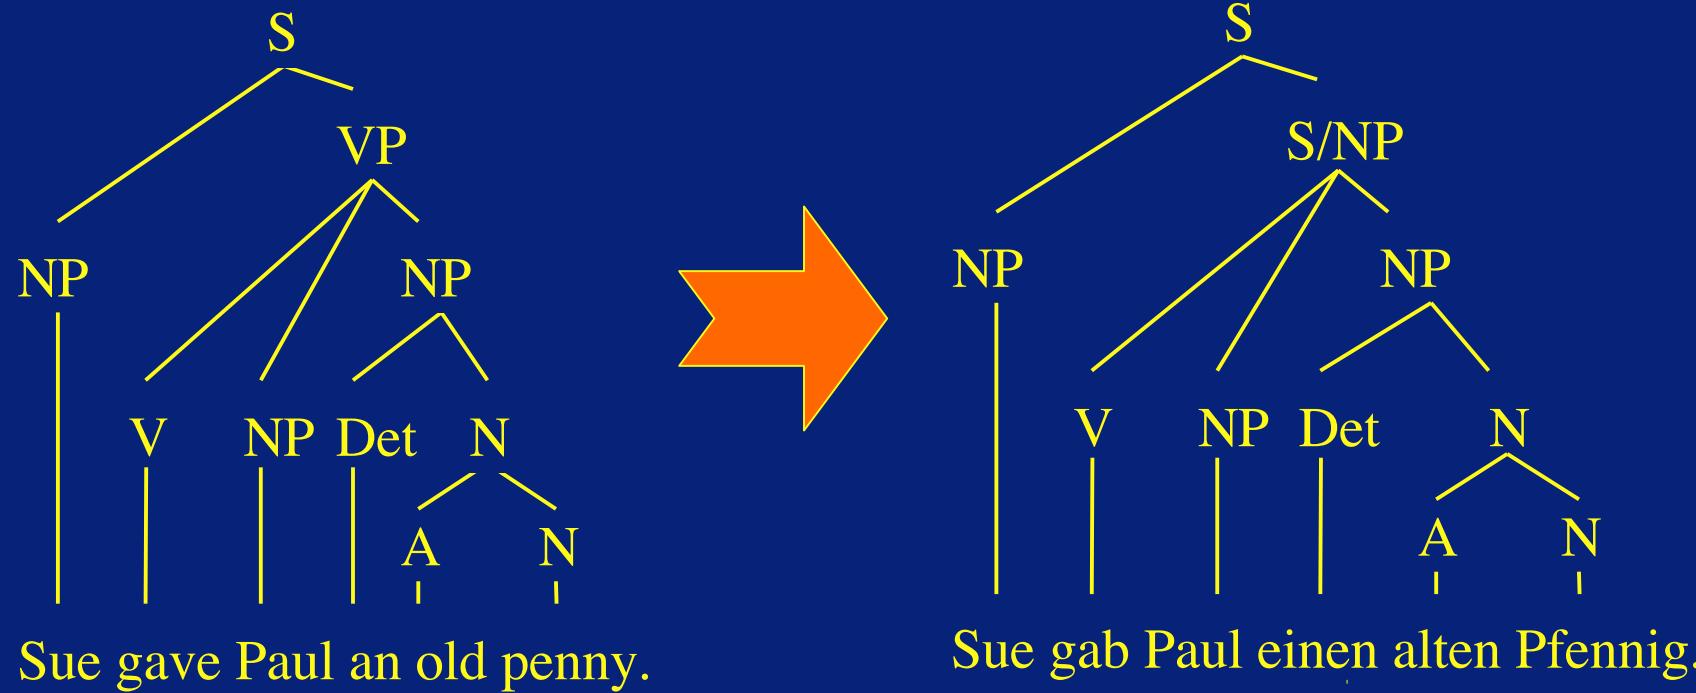

If you can talk  
you can sing.

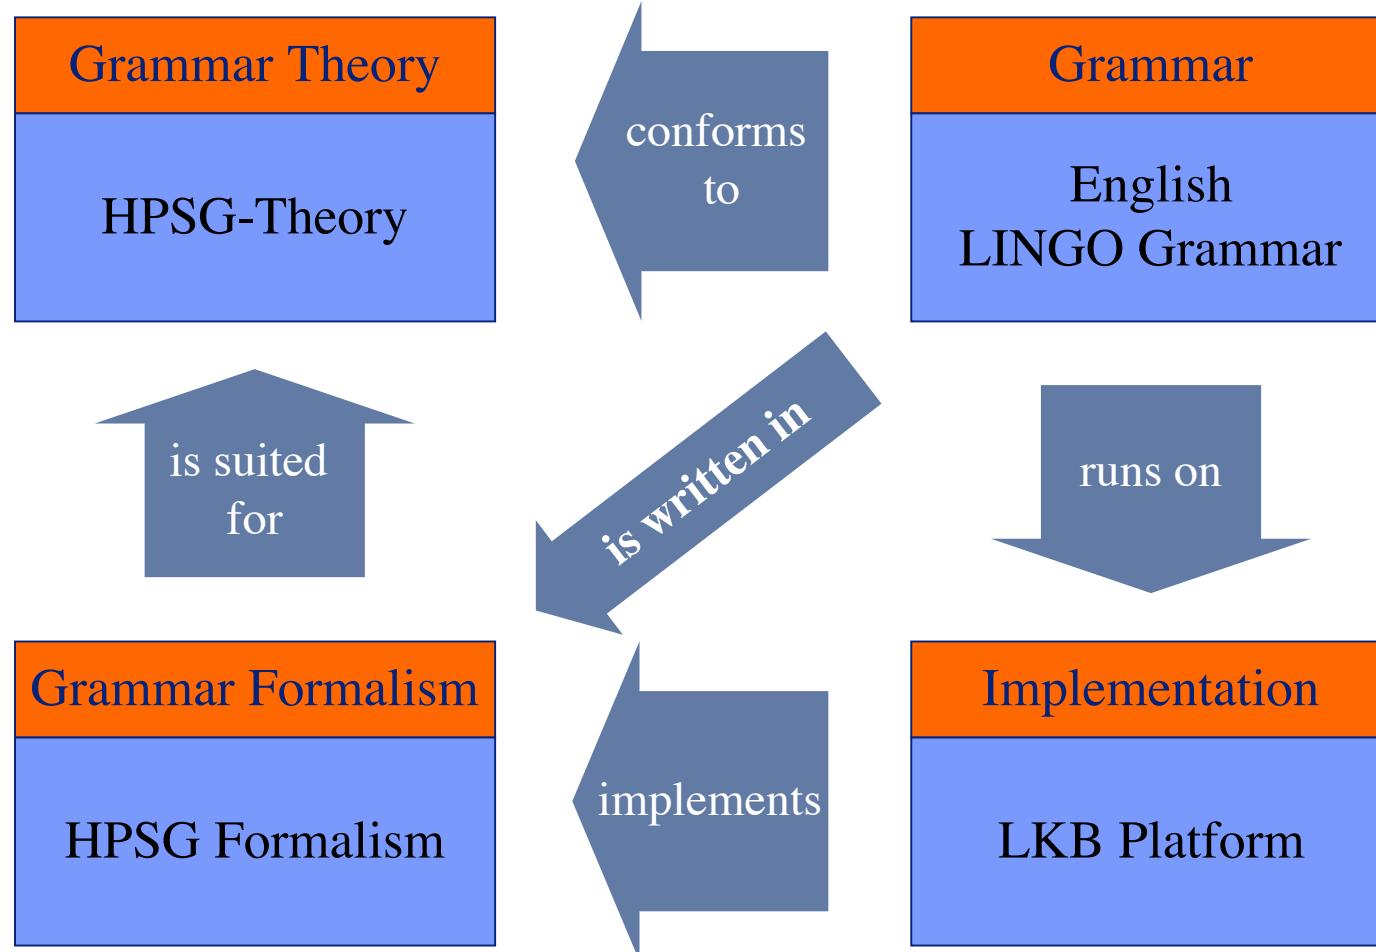

If you can parse,  
you can understand.

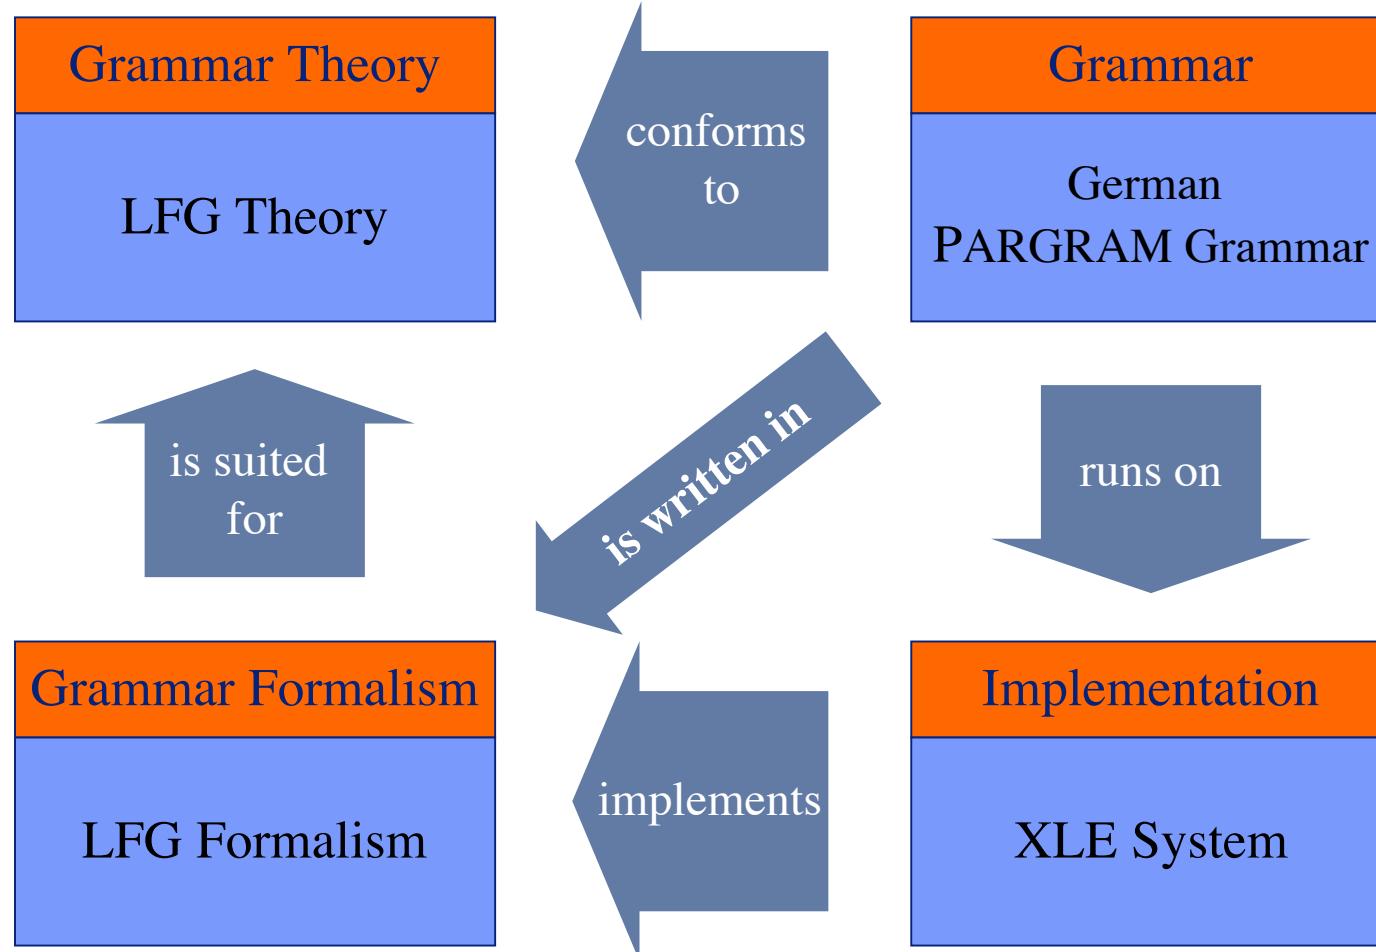

(Proverb from Zimbabwe, China,  
and maybe other places)

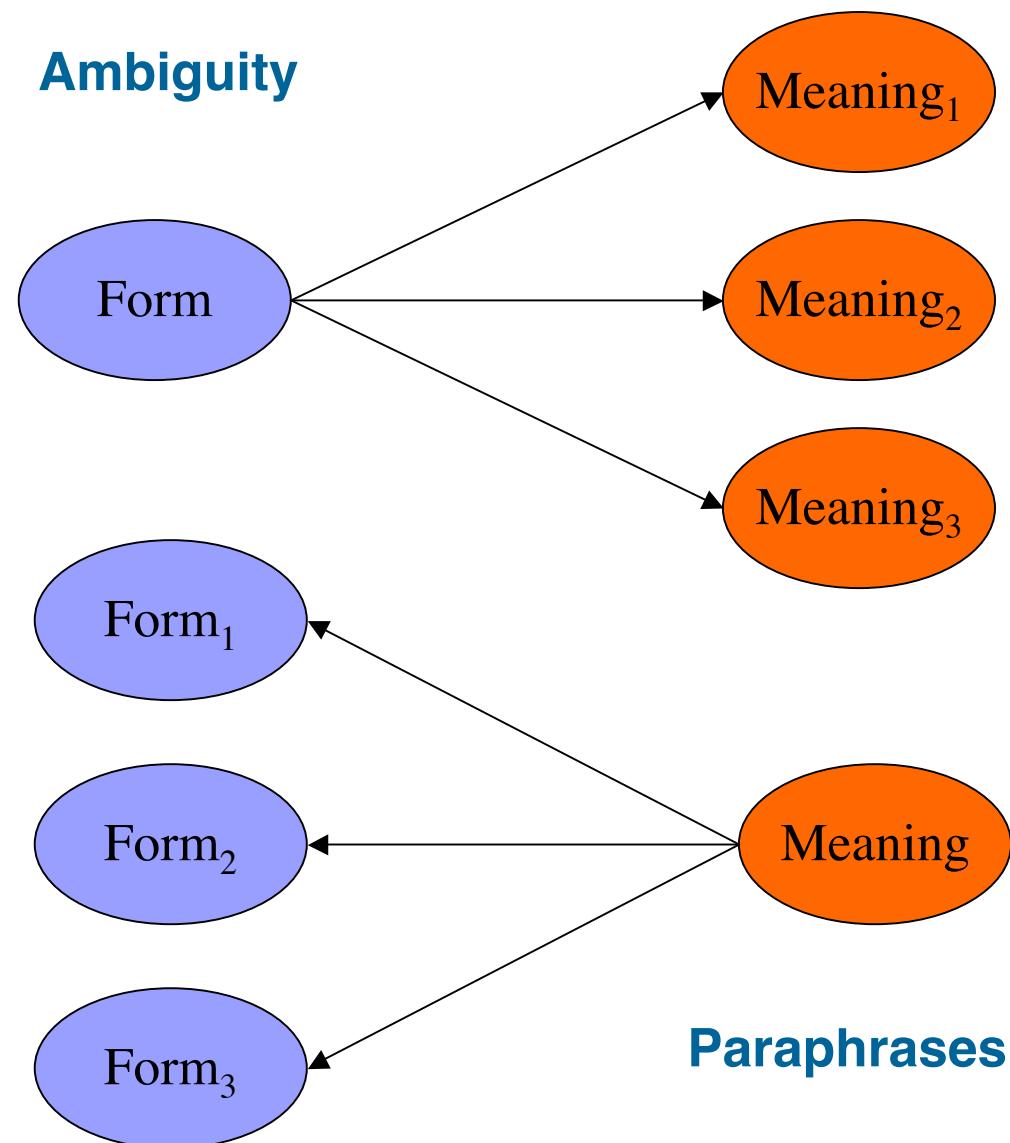

$\exists x[(\text{old}'(\text{penny}'))(x) \wedge (\text{Past}(\text{give}'(\text{sue}^{\text{c}}, \text{paul}^{\text{c}}, x)))]$

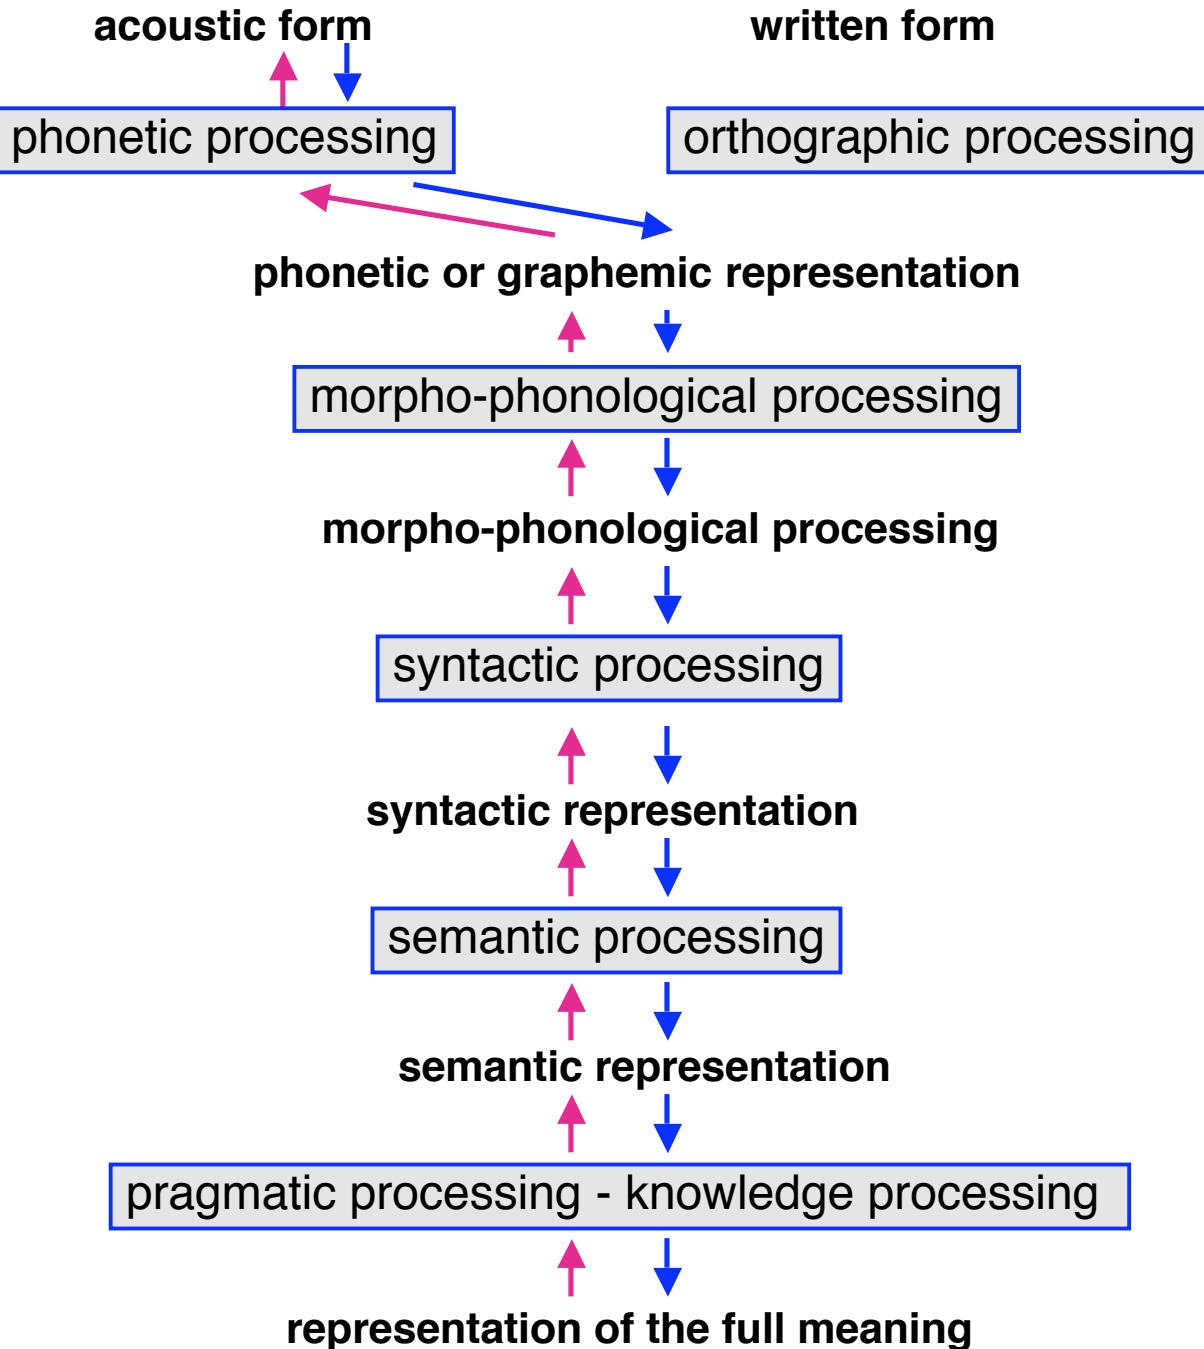

# Speech Translation

**phonetic (homophony):**

their

there

toe

tow

**orthographic (homography):**

read

read

undoable

undoable

**lexical (homonymy):**

bank

bank

ball

ball

### syntactic

*With the naked eye she  
couldn't see much.  
So she watched the man  
with a telescope.*

*She couldn't watch  
all suspects  
So she watched the man  
with a telescope.*

### semantic

The three selected special agents  
speak two foreign languages  
nearly without an accent.  
*Namely French and Russian.*

The three selected special agents  
speak two foreign languages  
nearly without an accent.  
*But only two of them master  
Russian.*

### pragmatic

Could you translate this text?  
*I need it tomorrow.*

Could you translate this text?  
*I even wonder if anybody could do it.*

Certain readings are less preferred than others:

*Where is a bank?*

*Do you like plants?*

The preference can be influenced by context.

*The goal keeper opened the ball.* vs. *The Mayor opened the ball.*

*The astronomer married a star.* vs. *The movie director married a star.*

*„Früher stellten die Frauen der Inseln am Wochenende Kopftücher mit  
in the past produced the women of the islands on the weekends scarfs with  
Blumenmotiven her, die ihre Männer an den folgenden Montagen auf dem  
flower patterns                   that their husbands on the following Mondays on the  
Markt im Zentrum der Hauptinsel verkauften.“  
market in the center of the main island sold.*

*In the past the women of the islands produced scarfs with flower patterns on the  
weekends that were sold by their husbands on the following Mondays on the market in  
the center of the main island.*

*The sentence exhibits a total of 13 lexical, syntactic and anaphoric ambiguities*

$$2 \times 2 \times 2 \times 3 \times 3 \times 2 \times 4 \times 2 \times 4 \times 2 \times 2 \times 7 \times 2 = \underline{258,048}$$

**phonetic:**

réport

repórt

innovative

innóvative

**orthographic:**

summarization

summarisation

co-ordination

coordination

**lexical:**

access road

feeder road

Fall

Autumn

**syntactic:**

I will very slowly pull out.

I will pull out very slowly.

He was recognized by all of us.

All of us recognized him.

**semantic:**

Not all students could attend.

Some students could not attend.

**pragmatic:**

Could you translate this text.

Please translate this text.

- Meaning is expressed by a formula in some logic
- candidates:
  - ◆ first order predicate logic (FOPL)
  - ◆ subsets of FOPL (Horn-clause logics, Description Logics)
  - ◆ some higher order logics such as modal logics
- some logical reasoning is performed by humans with great ease
  - ◆ If you skip classes, I have to flunk you.  $p \rightarrow q$
  - ◆ Either you don't skip classes or I have to flunk you  $\neg p \vee q$
- If Berlusconi becomes the next president of the European Commission, I'll become the emperor of China

- Go to the table with many screws lying on top.
- Are there many screws on the table?
- Hand me the big hammer?
- Is the hammer big?

- Linking of data and theories
- shared data, joint tasks and comparative evaluation
- replicability
- layers of annotations
- comments

- How is processing being realized?
- How is linguistic knowledge encoded?
- What are the representations?
- What are the algorithms for processing?

**Class of Approaches****heydays**

Direct Implementation

1960-1970

Specialized Algorithms and Methods

1970-1980

Declarative Grammar Formalisms

1980-1990

Statistical Approaches

1990-2000

Hybrid Processing Systems

since 2000

## Drawbacks of logical approaches

- ◆ lack of learning from data (by frequencies)
- ◆ lack of mechanisms for soft constraints
- ◆ lack of mechanisms for vagueness
- ◆ missing robustness w.r.t. ill-formed or unexpected input
- ◆ lack of efficiency

## Drawbacks of statistical approaches

- ◆ lack of general competence models
- ◆ lack of accuracy
- ◆ no reasoning
- ◆ lack of understanding the learned knowledge

Linguistics -- by tradition -- is not an exact or empirical science. Modern linguists have attempted to transform linguistics step by step into a science.

An exact science needs formalized models and provable methods for verifying (or more often falsifying) theories.

Empirical science needs a methodology of how to obtain, process, evaluate data and how to exploit data for the verification (falsification) of theories.

An exact empirical science needs to establish the correspondence between data and formal models. **Therefore data need to be interpreted.** Quantitative data require methods and tools for measurement.

In linguistics, the quantitative branch of the discipline has been disconnected from the theoretical core of the field for many decades, since quantitative linguists could not measure phenomena that were in the focus of discussion. It was language technology that finally brought them together.

Example: Astronomy

Photographs and spectral analyses of distant heavenly bodies are scientific data. However without their interpretation in relationship with the formal models, they are rather useless.

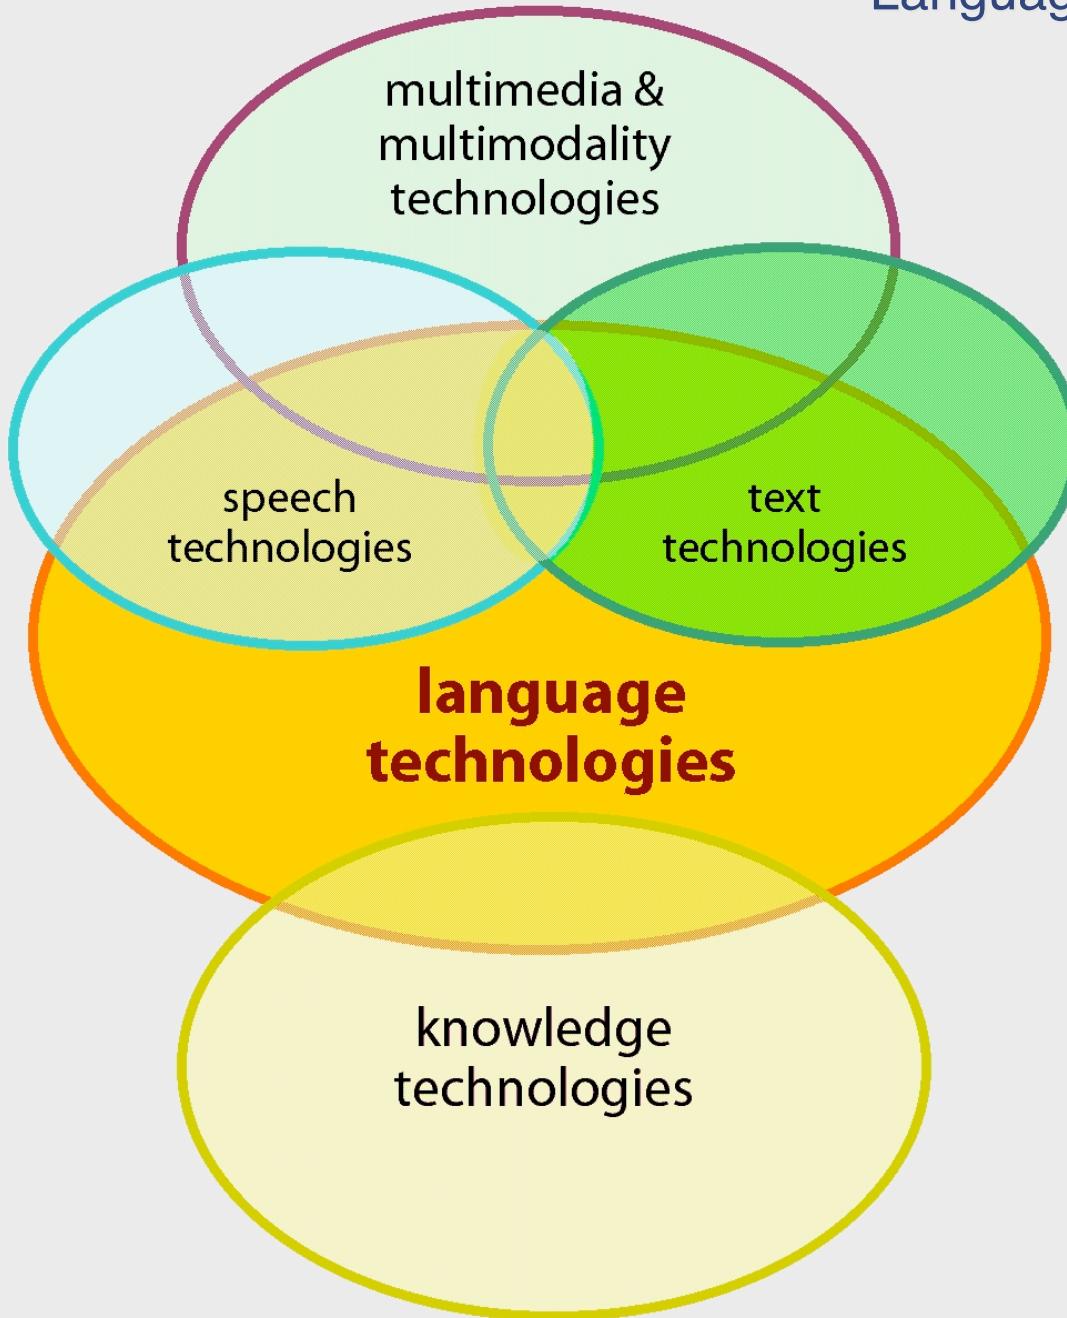

HANS USZKOREIT 2004

- ★ Theme: How can we build useful applications without any working methods for automatic language understanding?
  
- ★ Which applications do not require full understanding?

## Language Technologies

**Communication partners:**

humans and machines (technology),  
humans and humans  
humans and infostructure

**Modes and media for input and output:** text, speech, pictures, gestures

**Synchronicity:** synchronous vs. asynchronous

**Situatedness:** sensitivity to context, location, time, plans

**Type of linguality:** monolingual, multilingual, translingual

**Type of processing:** Categorization, summarization, extraction, understanding,  
translating, responding

**Level of linguistic description:** phonology, morphology, syntax,  
semantics, pragmatics

# What is a Technology

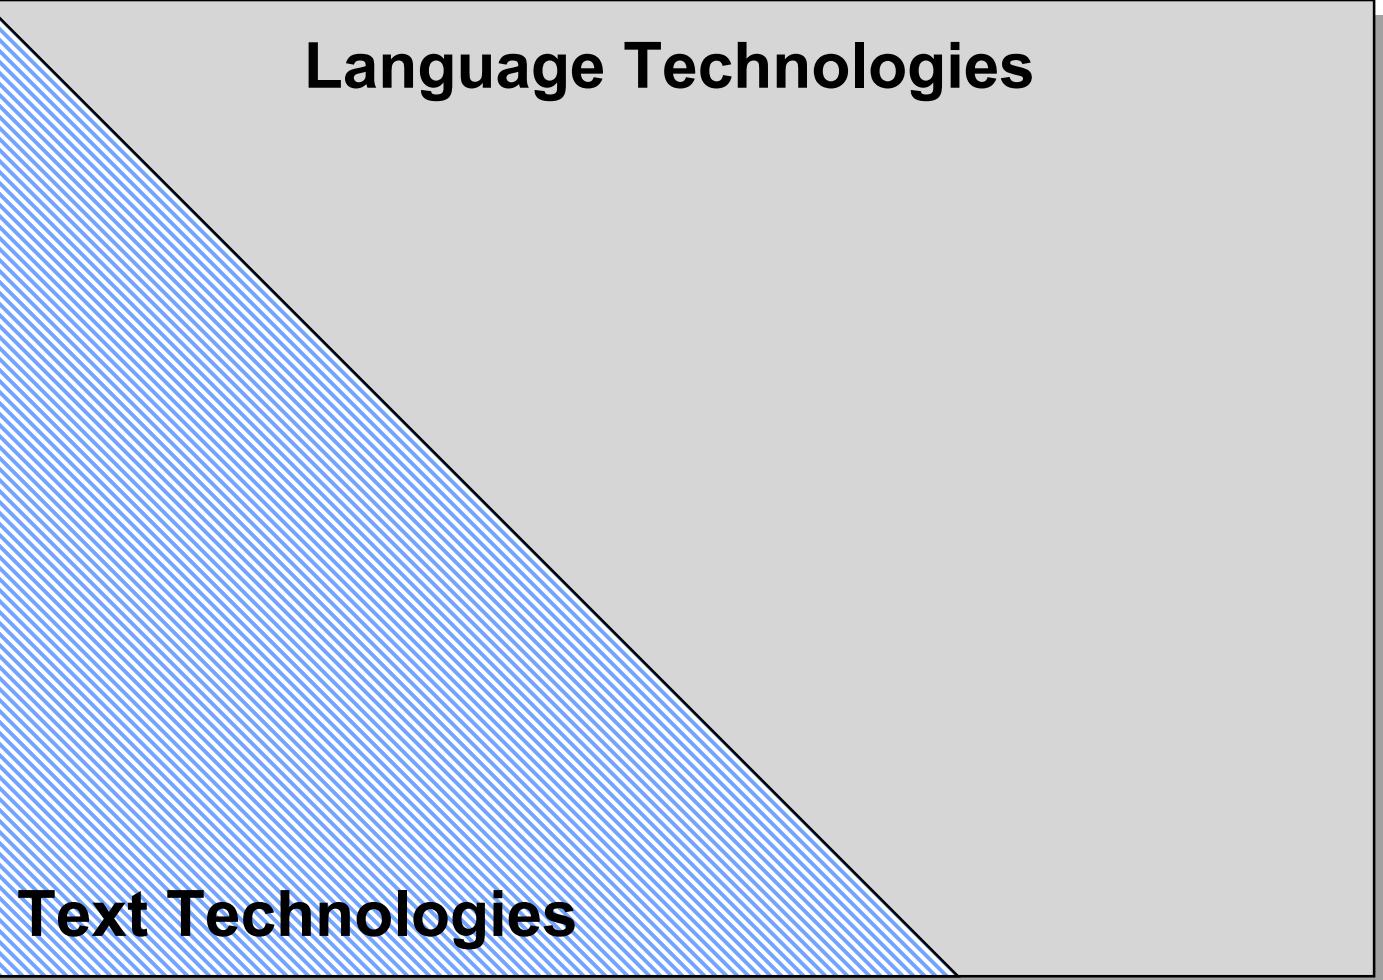

**Technology:** methods and techniques that together enable some application.

In real life usage of the word there is a continuum between methods and applications.

method/technique	finite state transduction
component technology	tokenizer
technology	named entity recognition
	high precision text indexing
application	concept based search engine

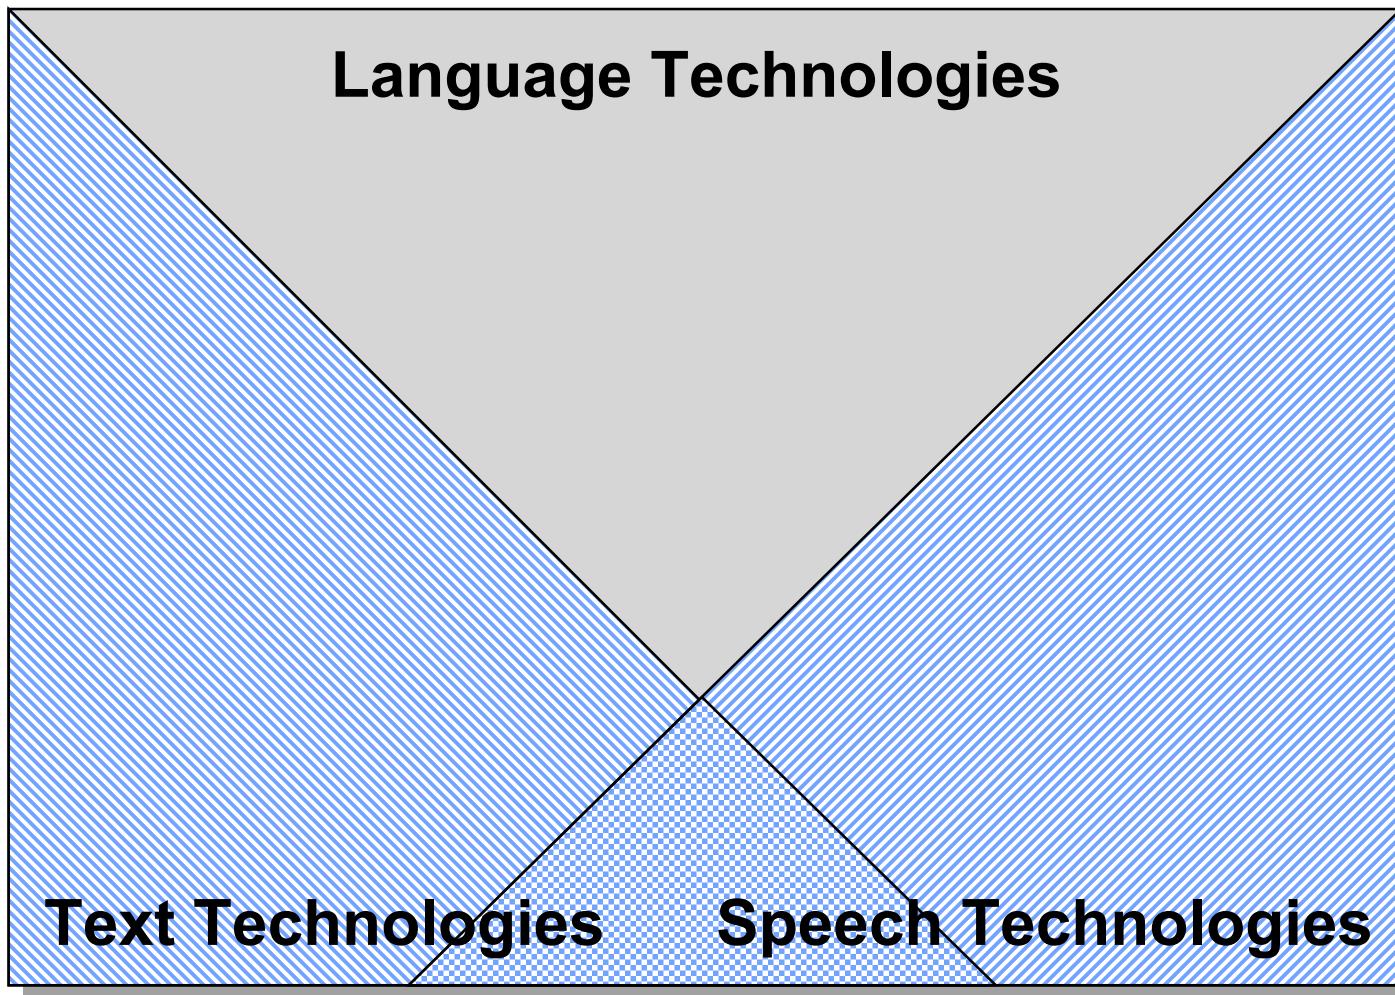

# Language Technologies

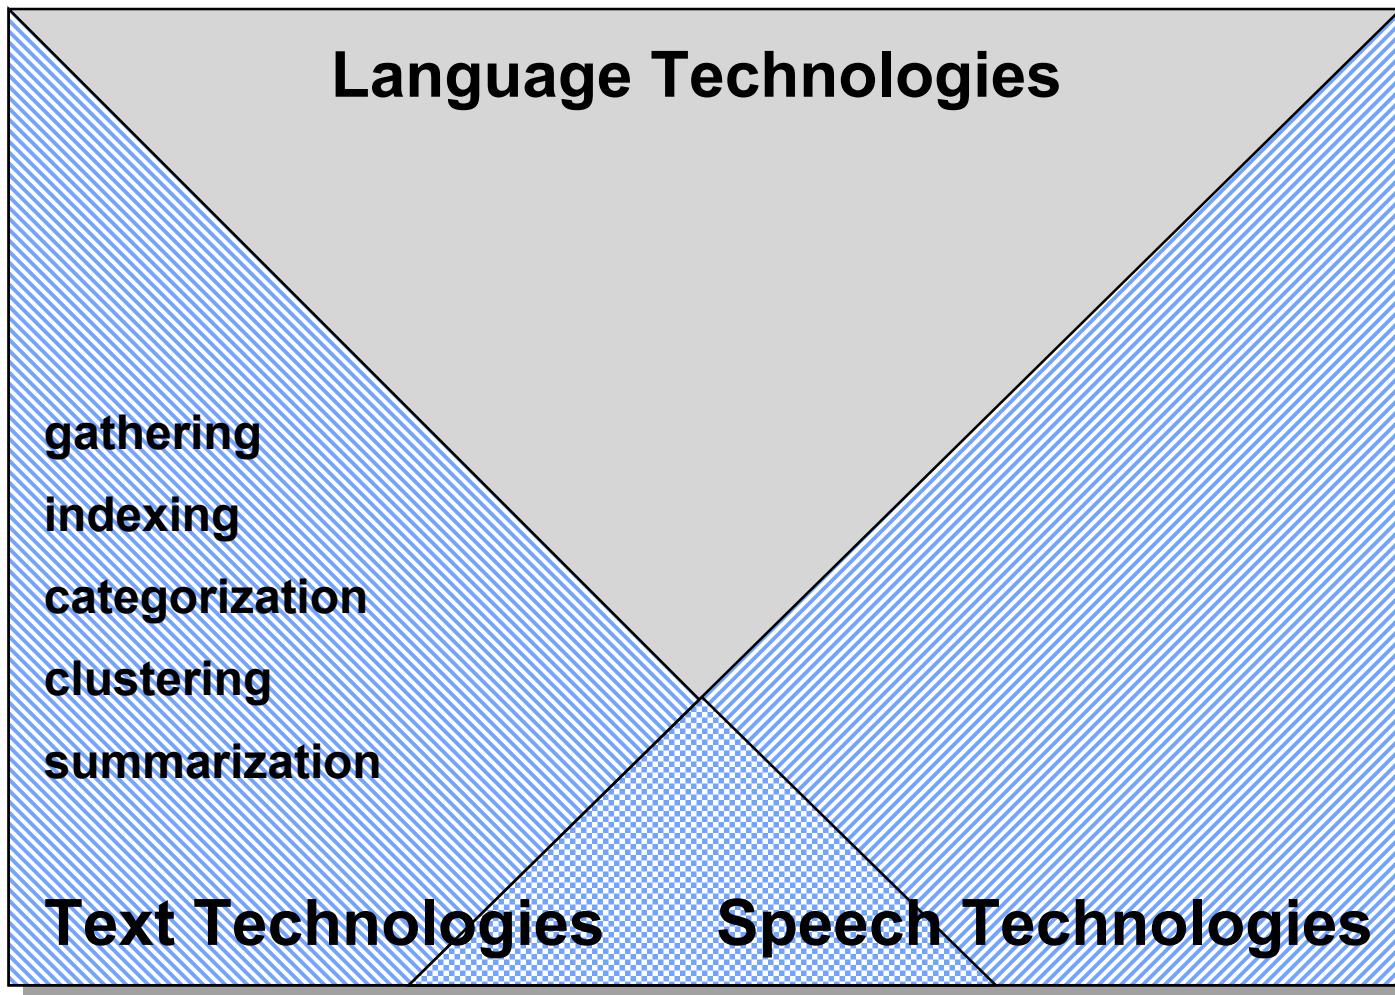

# Language Technologies

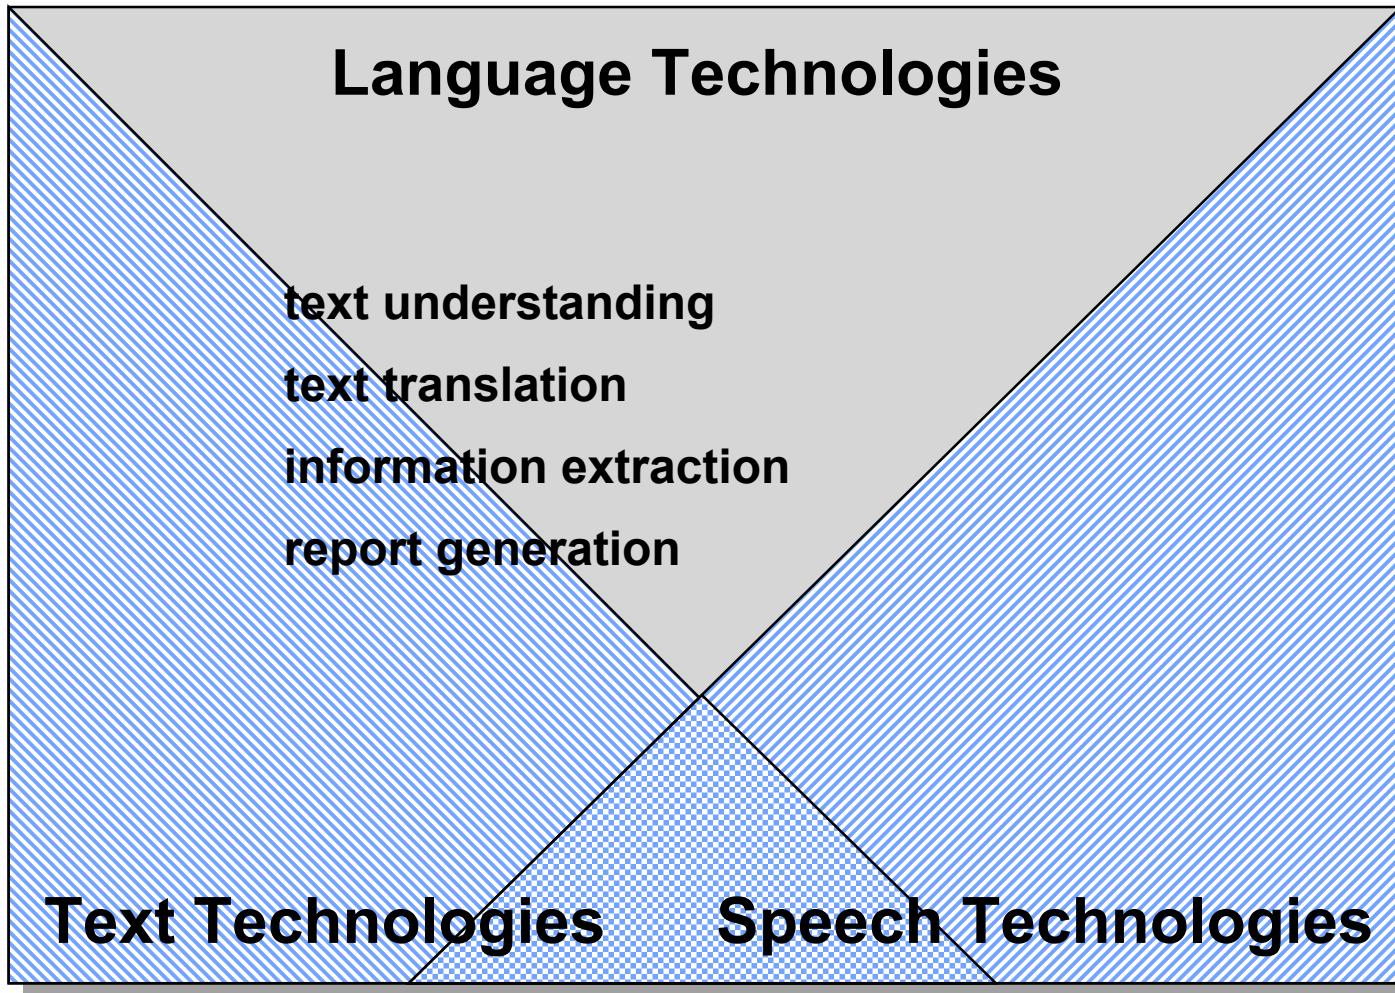

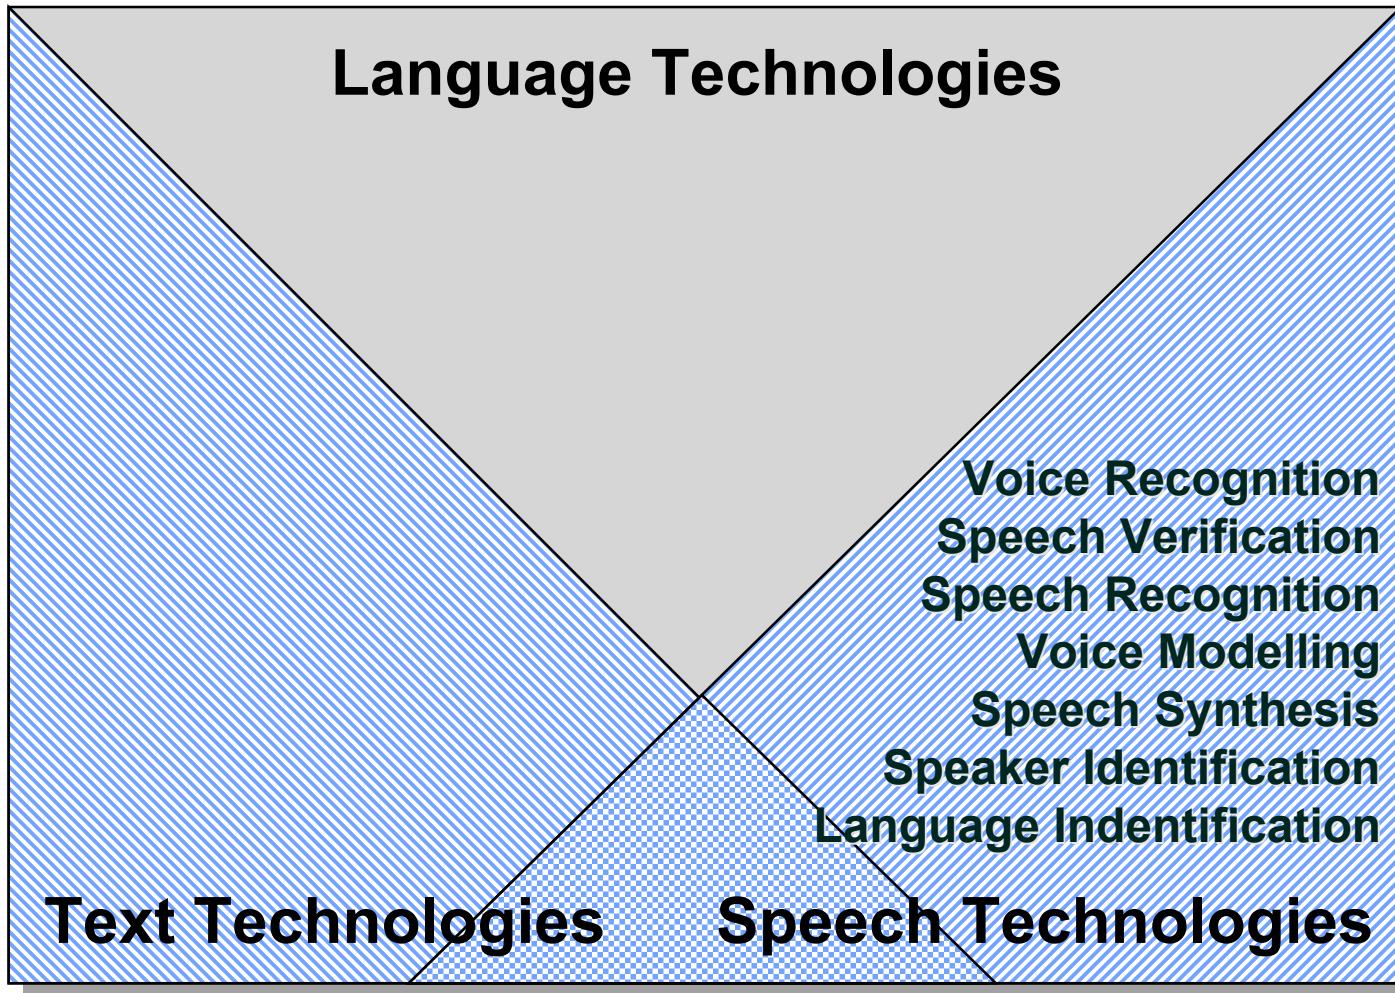

A large gray rectangle contains a blue triangle with fine diagonal hatching. The triangle's vertices are at the top-left corner of the gray area, the bottom-right corner of the gray area, and the bottom-left corner of the entire slide frame.

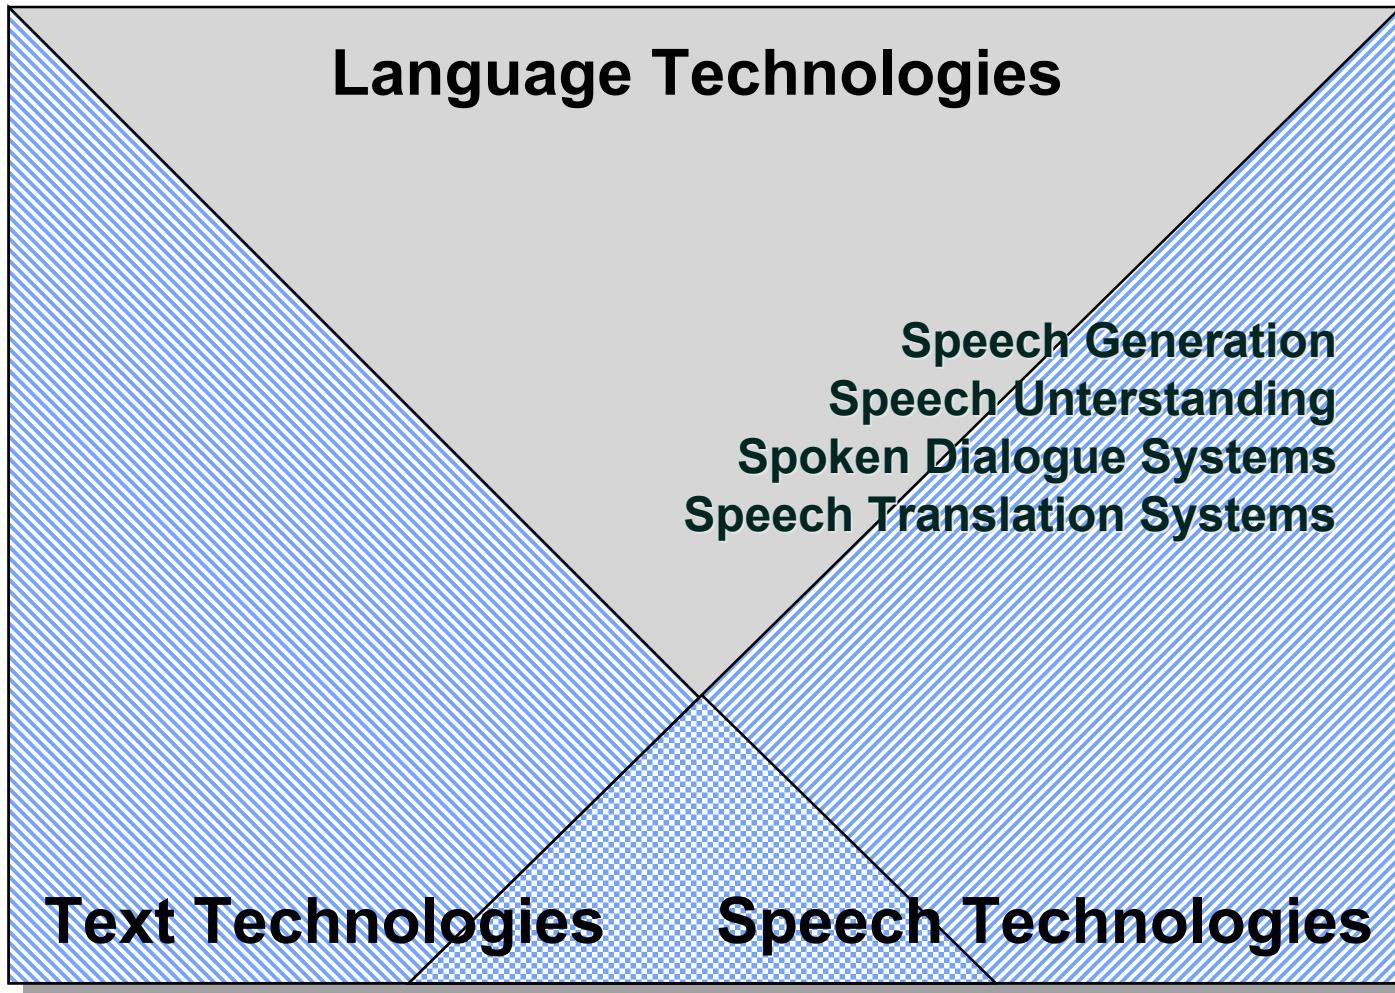

**Text Technologies**

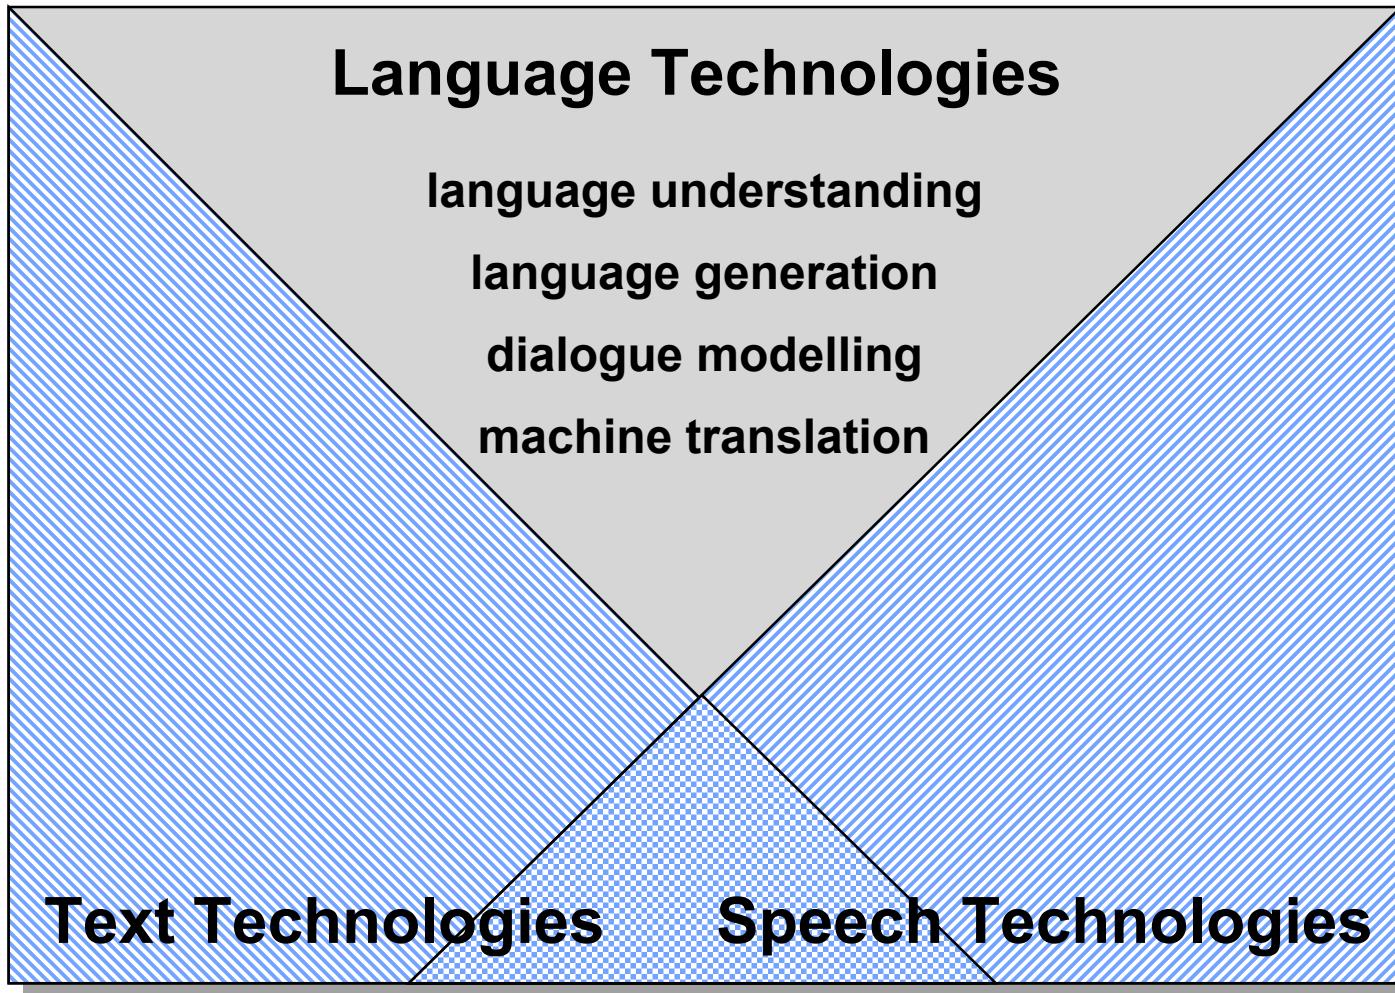

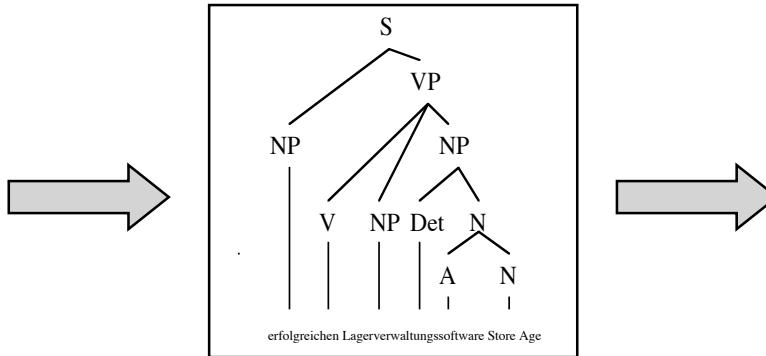

# Analysis and Generation

Die Bremer Firma Trade Consult hat auf einer Pressekonferenz in Hannover die Version 2.0 ihrer erfolgreichen Lagerverwaltungssoftware Store Age vorgestellt.

Die neue Version ermöglicht jetzt auch die zentrale Verwaltung mehrerer Lager und integriert die Lagerhaltung in das Supply Chain Management auf der Basis von SAP Software.

Auf der Pressekonferenz gab Geschäftsführer Franz Merleback auch die Umsatzzahlen der Softwareschmiede für das 3. Quartal bekannt. Wurden im zweiten Quartal bereits über 30 Millionen Mark umgesetzt, so konnte Merleback jetzt das stolze Ergebnis von 42,5 Millionen verkünden.

## Problematic Areas

- Plan Recognition
- Ellipsis
- Anaphora
- Cooperativity
- Clarification Dialogues

- Mirror human performance.
- Improve machine performance.
- Understand human processing.
- Understand why language is as it is.

- Linguistic Competence:

The knowledge a speaker has to possess in order to master a language.

The system of rules, principles and constraints that  
constitute the grammar of a language

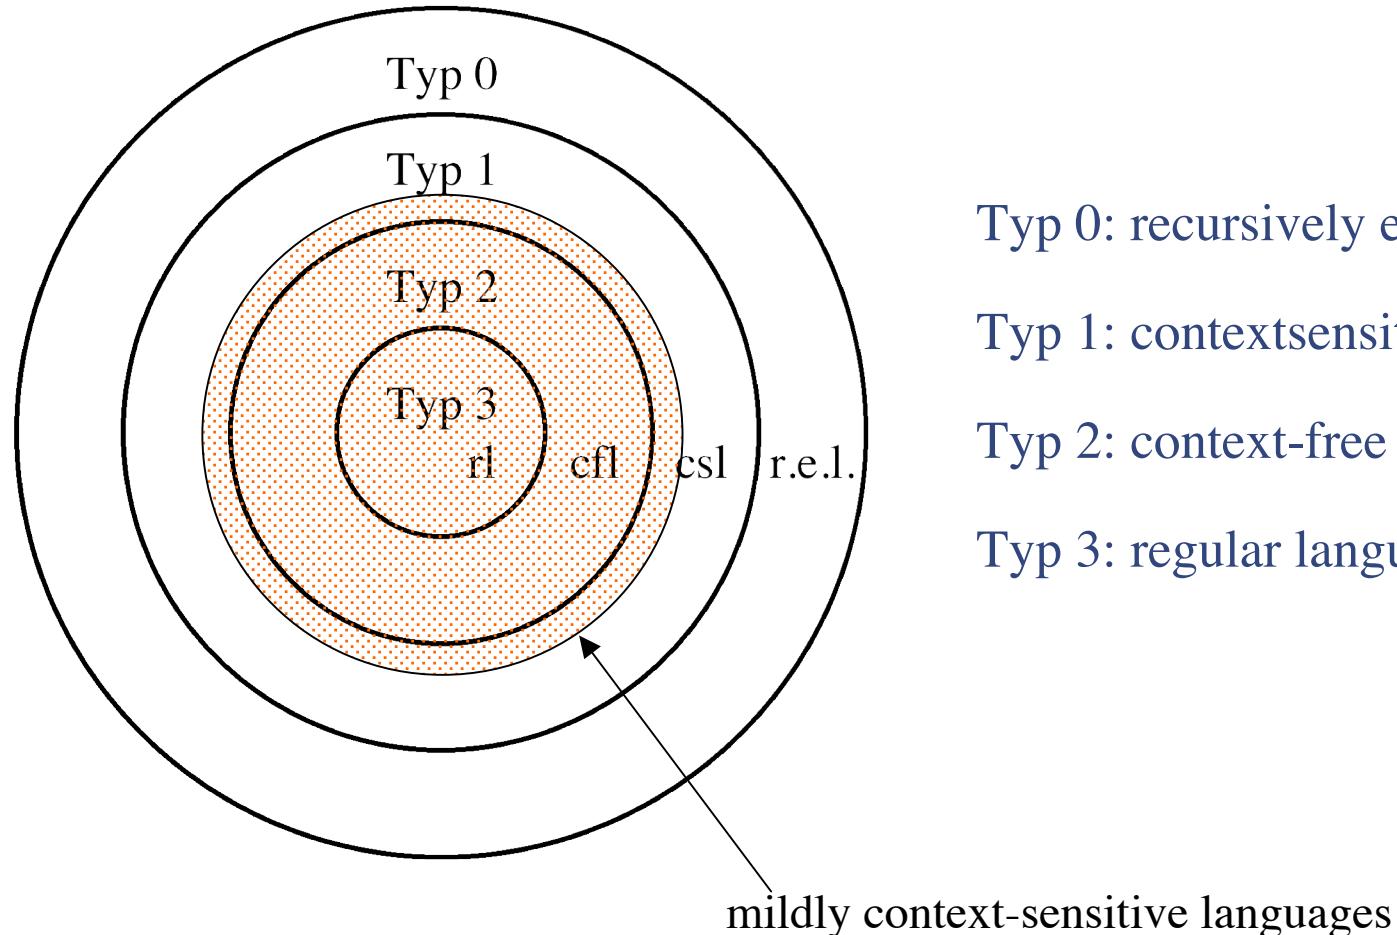

The finite definition of an infinite natural language.

- Linguistic Performance

The mechanisms and processes underlying actual human language use, i.e.,  
sentence production and comprehension.

This includes the influence (assisting or limitating) of other cognitive  
processes such as reasoning, perception and action  
as well as other tasks.

Typ 0: recursively enumerable sets

Typ 1: context-sensitive languages

Typ 2: context-free languages

Typ 3: regular languages

mildly context-sensitive languages

The predominant linguistic grammar formalisms have a polynomial or exponential worst-case parsing complexity.  
(for CF languages  $O(n^3)$ , where  $O$  is a constant and  $n$  is the length of the sentence)

Certain phenomena increase the parsing complexity.

Humans seem to analyze sentences in real time.

Why does syntax possess phenomena that make life harder?

The competence-performance distinction was necessary for the development of modern formal linguistics.

The majority of sentences generated (or accepted) by formal grammars cannot be generated or analyzed by human speakers.

Why does the grammar contain syntactic phenomena that make processing harder?  
examples:

- long-distance dependencies
- “free” word order
- right-extraposition
- parenthetical constructions

Hypothesis: When we understand the functional reasons for the evolution of these phenomena, our view of grammar and processing will change.

# A Performance Model Should Explain...

- ❑ why many ungrammatical sentences get produced
  - ↳ speech errors, grammar errors
- ❑ why many ungrammatical sentences are understood
  - ↳ communication with non-native speakers and children
- ❑ why many grammatical sentences are never produced
  - ↳ preferences in generation
- ❑ why many grammatical sentences cannot be understood
  - ↳ garden path sentences
- ❑ how processing is structured
  - ↳ efficiency and flow of control
- ❑ which effort do the steps or components require
  - ↳ dependence on other cognitive efforts (load)

*English:*

*In mud eels are, in clay are none.*

*German:*

*Mähen Äbte Heu?*

## Garden Path Sentences

*The canoe floated down the river sank.*

*The horse raced past the barn fell.*

but:

*The clothes put on the rack smelled.*

- Humans produce and comprehend sentences incrementally.
- We understand parts of the sentence while we still listen to the rest of the sentence.
- We already articulate parts of the sentence while we are still thinking about the rest of our statement.
- Both for understanding and generation we would prefer incremental algorithms.
- However, most approaches to language processing are sequential (pipeline) models without feedback to earlier components.

- The astronomer married a star.
- The canoe floated down the river sank.
- The three selected special agents speak two foreign languages nearly without an accent.

The competence-performance distinction was necessary for the development of modern formal linguistics.

The majority of sentences generated (or accepted) by formal grammars cannot be generated or analysed by human speakers.

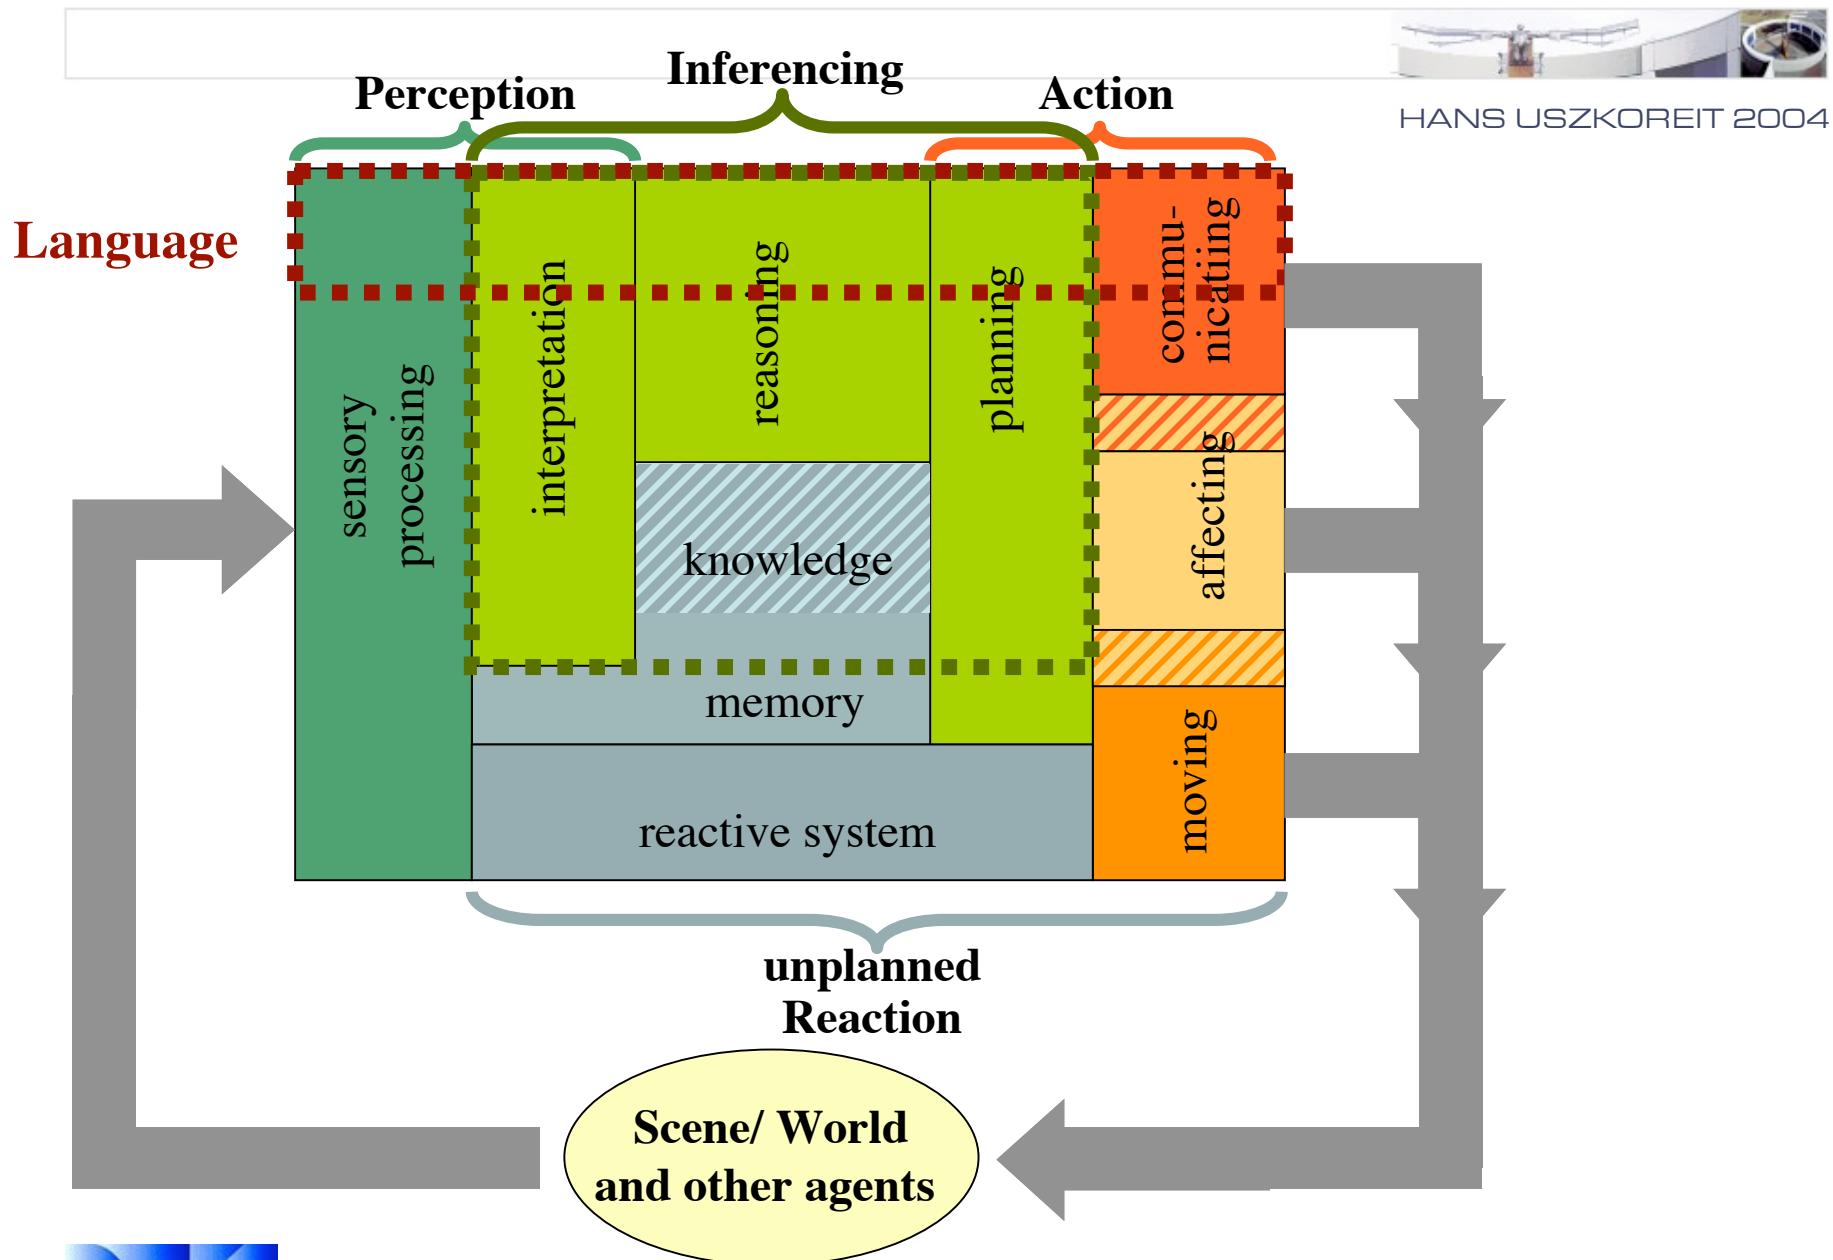

Why does the grammar contain syntactic phenomena that make processing harder?

examples:

- ◆ long-distance dependencies
- ◆ “free” word order
- ◆ right-extraposition
- ◆ parenthetical constructions

Hypothesis: When we understand the functional reasons for the evolution of these phenomena, our view of grammar and processing will change.

German Research Center for Artificial Intelligence GmbH

LST FOUNDATIONS COURSE 2004/2005

- ★ Derive convincing solutions to the ambiguity problem:
  - by fusing constraints from knowledge (reasoning about context and general knowledge), perception, language (context and grammar), intention and attention
- ★ Study realistic and cognitively plausible models of language learning
  - by combining learning about spatial concepts, objects and language in communicative learning situations
- ★ Investigate realistic communication situations and get at real language understanding
- ★ Gain insights on the functional properties of language
