Textbooks

L.T.F. Gamut. Logic, Language and Meaning. Volume I:
Introduction to Logic, University of Chicago Press, 1991.

Barbara H. Partee, Alice ter Meulen, Robert E. Wall.
Mathematical Methods in Linguistics. Springer, 1990.

2

Arguments

- (1) a. If it rains, then the street is wet
b. It rains
c. Therefore, the street is wet
- (2) a. If it rains, then the street is wet
b. The street is not wet
c. Therefore, it does not rain
- (3) a. If it rains, then the street is wet
b. The street is wet
c. Therefore, it rains

3

Arguments

- (4) a. All man are mortal
b. Sokrates is a man
c. Therefore, Sokrates is mortal

$$\begin{array}{l} \forall x(H(x) \rightarrow M(x)) \\ H(s) \\ \hline \therefore M(s) \end{array}$$

4

Predicate Logic – Vocabulary

- **Non-logical expressions:**
 - Set of individual constants: CON (possibly empty)
 - Set of n-place relation constants: $PRED^n$, for all $n \geq 0$ (possibly empty)
- **Infinite set of individual variables:** VAR (infinite set)

5

Predicate Logic – Syntax

- **Terms:** $TERM = VAR \cup CON$
- **Atomic formulas:**
 - $R(t_1, \dots, t_n)$ for $R \in PRED^n$ and $t_1, \dots, t_n \in TERM$
 - $t_1 = t_2$ for $t_1, t_2 \in TERM$
- **Well-formed formulas (WFF)**
 - all atomic formulas are WFF
 - if ϕ and ψ are WFF, then $\neg\phi$, $(\phi \wedge \psi)$, $(\phi \vee \psi)$, $(\phi \rightarrow \psi)$, $(\phi \leftrightarrow \psi)$ are WFF
 - if $x \in VAR$, and ϕ is a WFF, then $\forall x\phi$ and $\exists x\phi$ are WFF
 - nothing else is a WFF

6

Quantification

$\exists xA$ - "there is an x such that A "

$\forall xA$ - "for every x it is the case that A "

7

Exercise – Formalization

(1) *John and Mary work*

$\mapsto \text{work}'(j) \wedge \text{work}'(m)$

(2) *A student works*

$\mapsto \exists x(\text{student}'(x) \wedge \text{work}'(x))$

(3) *A blond student works*

$\mapsto \exists x(\text{student}'(x) \wedge \text{blond}'(x) \wedge \text{work}'(x))$

(4) *A blond student works hard*

$\mapsto \exists x(\text{student}'(x) \wedge \text{blond}'(x) \wedge \text{work-hard}'(x))$

8

Exercise – Translate into PL

(1) *Mary loves a student*

$\mapsto \exists x(\text{student}'(x) \wedge \text{love}'(m, x))$

(2) *Every student works*

$\mapsto \forall x (\text{student}'(x) \rightarrow \text{work}'(x))$

(3) *Nobody flunked*

$\mapsto \neg \exists x \text{flunk}'(x)$

(4) *Barking dogs don't bite*

$\mapsto \forall x ((\text{dog}'(x) \wedge \text{bark}'(x)) \rightarrow \neg \text{bite}'(x))$

9

Scope

- If $\forall x\phi$ ($\exists x\phi$) is a subformula of a formula ψ , then ϕ is the **scope** of this occurrence of $\forall x$ ($\exists x$) in ψ .
- We distinguish distinct occurrences of quantifiers as there are formulae like $\forall xA(x) \wedge \forall xB(x)$.
- Examples:
 - $\exists x(\forall y(T(y) \leftrightarrow x=y) \wedge F(x))$
 - $\forall x[A(x)] \wedge \forall x[B(x)]$

10

Free and Bound Variables

- An occurrence of a variable x in a formula ϕ is **free in ϕ** if this occurrence of x does not fall within the scope of a quantifier $\forall x$ or $\exists x$ in ϕ .
- If $\forall x\psi$ ($\exists x\psi$) is a subformula of ϕ and x is free in ψ , then this occurrence of x is **bound by** this occurrence of the quantifier $\forall x$ ($\exists x$).
- Examples:
 - $\forall x(A(x) \wedge B(x))$ – x occurs bound in $B(x)$
 - $\forall x A(x) \wedge B(x)$ – x occurs free in $B(x)$
- **A sentence** is a formula without free variables.

11

Predicate Logic – Semantics

- Expressions of Predicate Logic are interpreted relative to **model structures** and **variable assignments**.
- Model structures are our “mathematical picture” of the world. They provide interpretations for the non-logical symbols (predicate symbols, individual constants).
- Variable assignments provide interpretations for variables.

12

Model structures

- **Model structure:** $M = \langle U_M, V_M \rangle$
 - U_M is non-empty set - the “universe”
 - V_M is an interpretation function assigning individuals ($\in U_M$) to individual constants and n-ary relations over U_M to n-place predicate symbols:
 - $V_M(P) \subseteq U_M^n$ if P is an n-place predicate symbol
 - $V_M(c) \in U_M$ if c is an individual constant
- **Assignment function** for variables $g: \text{VAR} \rightarrow U_M$

13

Model structures - Example

$M = \langle U_M, V_M \rangle$
 $U_M = \{ r_1, r_2, h_1, h_2 \}$
 $V_M(\text{vincent}) = r_1$
 $V_M(\text{mia}) = r_2$
 $V_M(\text{rabbit}) = \{ r_1, r_2 \}$
 $V_M(\text{white}) = \{ r_2 \}$
 $V_M(\text{hat}) = \{ h_1, h_2 \}$
 $V_M(\text{in}) = \{ (r_1, h_1) \}$

14

Interpretation (terms)

Interpretation of terms with respect to a model structure M and a variable assignment g :

$$\llbracket \alpha \rrbracket^{M,g} = \begin{cases} V_M(\alpha) & \text{if } \alpha \text{ is an individual constant} \\ g(\alpha) & \text{if } \alpha \text{ is a variable} \end{cases}$$

15

Interpretation (atomic formulas)

Interpretation of (atomic) formulas with respect to a model structure M and variable assignment g :

$$\llbracket R(t_1, \dots, t_n) \rrbracket^{M,g} = 1 \text{ iff } (\llbracket t_1 \rrbracket^{M,g}, \dots, \llbracket t_n \rrbracket^{M,g}) \in V_M(R)$$

$$\llbracket t_1 = t_2 \rrbracket^{M,g} = 1 \text{ iff } \llbracket t_1 \rrbracket^{M,g} = \llbracket t_2 \rrbracket^{M,g}$$

16

Is Vincent a rabbit?

$$\llbracket \text{rabbit}(\text{vincent}) \rrbracket^{M,g} = 1$$

- iff $\llbracket \text{vincent} \rrbracket^{M,g} \in V_M(\text{rabbit})$
- iff $V_M(\text{vincent}) \in V_M(\text{rabbit})$

$$\begin{aligned} M &= (U_M, V_M) \\ U_M &= \{ r_1, r_2, h_1, h_2 \} \\ V_M(\text{vincent}) &= r_1 \\ V_M(\text{mia}) &= r_2 \\ V_M(\text{rabbit}) &= \{ r_1, r_2 \} \\ V_M(\text{white}) &= \{ r_2 \} \\ V_M(\text{hat}) &= \{ h_1, h_2 \} \\ V_M(\text{in}) &= \{ (r_1, h_1) \} \end{aligned}$$

17

Interpretation (connectives)

Connectives are **truth-functional**: the truth-value of a complex expression is determined by the truth-values of their subformulas.

$$\llbracket \neg \varphi \rrbracket^{M,g} = 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 0$$

$$\llbracket \varphi \wedge \psi \rrbracket^{M,g} = 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 1 \text{ and } \llbracket \psi \rrbracket^{M,g} = 1$$

$$\llbracket \varphi \vee \psi \rrbracket^{M,g} = 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 1 \text{ or } \llbracket \psi \rrbracket^{M,g} = 1$$

$$\llbracket \varphi \rightarrow \psi \rrbracket^{M,g} = 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 0 \text{ or } \llbracket \psi \rrbracket^{M,g} = 1$$

$$\llbracket \varphi \leftrightarrow \psi \rrbracket^{M,g} = 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = \llbracket \psi \rrbracket^{M,g}$$

18

Truth-functional connectives

- A connective is **truth-functional** iff the truth value of any compound statement obtained by applying that connective is a function of the individual truth values of the constituent statements that form the compound.
- **Truth-functional connectives:**
substituting sub-expressions with the same truth-value does not change the truth of the complete expression.

19

Truth-functional connectives

- (1) *John bumped his head **and** he [John] is crying*
- (2) *John bumped his head **and** it is raining*
- (3) *John is crying*
- (4) *It is raining*

- Assume that (3) and (4) have the same truth-value.
 - Then (1) and (2) must have the same truth-value
 - **and** is a truth-functional connective

20

Truth-functional connectives

- (1) *John is crying **because** he [John] bumped his head*
- (2) *John is crying **because** it is raining*
- (3) *John bumped his head*
- (4) *It is raining*

- Assume that (3) and (4) have the same truth-value.
 - (1) and (2) can have different truth-values
 - \Rightarrow **because** is not truth-functional

21

Is Vincent a white rabbit?

$\llbracket \text{rabbit}(\text{vincent}) \wedge \text{white}(\text{vincent}) \rrbracket^{M,g} = 1$

- iff $\llbracket \text{rabbit}(\text{vincent}) \rrbracket^{M,g} = 1$
and $\llbracket \text{white}(\text{vincent}) \rrbracket^{M,g} = 1$
- iff $V_M(\text{vincent}) \in V_M(\text{rabbit})$
and $V_M(\text{vincent}) \in V_M(\text{white})$

$$\begin{aligned} M &= (U_M, V_M) \\ U_M &= \{ r_1, r_2, h_1, h_2 \} \\ V_M(\text{vincent}) &= r_1 \\ V_M(\text{mia}) &= r_2 \\ V_M(\text{rabbit}) &= \{ r_1, r_2 \} \\ V_M(\text{white}) &= \{ r_2 \} \\ V_M(\text{hat}) &= \{ h_1, h_2 \} \\ V_M(\text{in}) &= \{ (r_1, h_1) \} \end{aligned}$$

22

Interpretation (quantifiers)

We want:

- $\llbracket \forall x A(x) \rrbracket^{M,g} = 1$ iff for every $d \in U_M$, $d \in \llbracket A \rrbracket^{M,g}$
- $\llbracket \exists x A(x) \rrbracket^{M,g} = 1$ iff there is a $d \in U_M$ such that $d \in \llbracket A \rrbracket^{M,g}$

23

Interpretation (quantifiers)

- **Interpretation of formulas** with respect to a model structure M and variable assignment g :
 - $\llbracket \exists x \varphi \rrbracket^{M,g} = 1$ iff there is a $d \in U_M$ such that $\llbracket \varphi \rrbracket^{M,g[x/d]} = 1$
 - $\llbracket \forall x \varphi \rrbracket^{M,g} = 1$ iff for all $d \in U_M$, $\llbracket \varphi \rrbracket^{M,g[x/d]} = 1$
- $g[x/d]$ is the variable assignment which is identical to g except that it assigns the individual d to variable x .

$$g[x/d](y) = \begin{cases} d & \text{if } x = y \\ g[x/d](y) = g(y) & \text{if } x \neq y \end{cases}$$

24

Variable assignments

$$g[x/d](y) = \begin{cases} d & \text{if } x = y \\ g[x/d](y) = g(y) & \text{if } x \neq y \end{cases}$$

	x	y	z	u	...
g	a	b	c	d	...
g[x/a]	a	b	c	d	...
g[y/a]	a	a	c	d	...
g[y/g(z)]	a	c	c	d	...
g[y/a][u/a]	a	a	c	a	...
g[y/a][y/b]	a	b	c	d	...

25

Predicate Logic: Semantics

Interpretation of formulas with respect to a model structure M and variable assignment g:

$$\begin{aligned} \llbracket R(t_1, \dots, t_n) \rrbracket^{M,g} &= 1 \text{ iff } \langle \llbracket t_1 \rrbracket^{M,g}, \dots, \llbracket t_n \rrbracket^{M,g} \rangle \in V_M(R) \\ \llbracket t_1 = t_2 \rrbracket^{M,g} &= 1 \text{ iff } \llbracket t_1 \rrbracket^{M,g} = \llbracket t_2 \rrbracket^{M,g} \\ \llbracket \neg \varphi \rrbracket^{M,g} &= 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 0 \\ \llbracket \varphi \wedge \psi \rrbracket^{M,g} &= 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 1 \text{ and } \llbracket \psi \rrbracket^{M,g} = 1 \\ \llbracket \varphi \vee \psi \rrbracket^{M,g} &= 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 1 \text{ or } \llbracket \psi \rrbracket^{M,g} = 1 \\ \llbracket \varphi \rightarrow \psi \rrbracket^{M,g} &= 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = 0 \text{ or } \llbracket \psi \rrbracket^{M,g} = 1 \\ \llbracket \varphi \leftrightarrow \psi \rrbracket^{M,g} &= 1 \text{ iff } \llbracket \varphi \rrbracket^{M,g} = \llbracket \psi \rrbracket^{M,g} \\ \llbracket \exists x \varphi \rrbracket^{M,g} &= 1 \text{ iff there is a } d \in U_M \text{ such that } \llbracket \varphi \rrbracket^{M,g[x/d]} = 1 \\ \llbracket \forall x \varphi \rrbracket^{M,g} &= 1 \text{ iff for all } d \in U_M, \llbracket \varphi \rrbracket^{M,g[x/d]} = 1 \end{aligned}$$

26

Every rabbit is in a hat

$$\llbracket \forall x(\text{rabbit}(x) \rightarrow \exists y(\text{hat}(y) \wedge \text{in}(x, y))) \rrbracket^{M,g} = 1$$

- iff ... [\Rightarrow whiteboard]

$M = (U_M, V_M)$
$U_M = \{ r_1, r_2, h_1, h_2 \}$
$V_M(\text{vincent}) = r_1$
$V_M(\text{mia}) = r_2$
$V_M(\text{rabbit}) = \{ r_1, r_2 \}$
$V_M(\text{white}) = \{ r_2 \}$
$V_M(\text{hat}) = \{ h_1, h_2 \}$
$V_M(\text{in}) = \{ (r_1, h_1) \}$

27

Not every rabbit is white

$\llbracket \neg \forall x (\text{rabbit}(x) \rightarrow \text{white}(x)) \rrbracket^{M, g} = 1$

- iff ... [\Rightarrow whiteboard]

$$\begin{aligned} M &= (U_M, V_M) \\ U_M &= \{ r_1, r_2, h_1, h_2 \} \\ V_M(\text{vincent}) &= r_1 \\ V_M(\text{mia}) &= r_2 \\ V_M(\text{rabbit}) &= \{ r_1, r_2 \} \\ V_M(\text{white}) &= \{ r_2 \} \\ V_M(\text{hat}) &= \{ h_1, h_2 \} \\ V_M(\text{in}) &= \{ (r_1, h_1) \} \end{aligned}$$

28

More Examples

- $\llbracket \exists x (\forall x A(x) \wedge B(x)) \rrbracket^{M, g} = 1$ iff ...
- $\llbracket \forall x A(x) \wedge B(x) \rrbracket^{M, g} = 1$ iff ...
- $\llbracket \exists x \forall y L(x, y) \rrbracket^{M, g} = 1$ iff ...
- $\llbracket \forall y \exists x L(x, y) \rrbracket^{M, g} = 1$ iff ...

29

True, Valid, Satisfiable

- **A formula φ is true in a model structure M** iff $\llbracket \varphi \rrbracket^{M, g} = 1$ for every variable assignment g
- **A formula φ is valid ($\models \varphi$)** iff φ is true in all model structures
- **A formula φ is satisfiable** iff there is at least one model structure M such that φ is true in M

30

Satisfiable? Valid?

- (1) $\forall x F(x) \rightarrow \exists x F(x)$
- (2) $\exists x \forall y \Phi \rightarrow \forall y \exists x \Phi$
- (3) $\exists x (F(x) \wedge \neg F(x))$
- (4) $\exists x F(x) \vee \neg F(x)$

31

Entailment

- **A set of formulas Γ is (simultaneously) satisfiable** iff there is a model structure M such that every formula in Γ is true in M (“ M satisfies Γ ,” or “ M is a model of Γ ”)
- **Γ is contradictory** if Γ is not satisfiable.
- **Γ entails a formula ϕ ($\Gamma \models \phi$)** iff ϕ is true in every model structure that satisfies Γ

32

Example [\Rightarrow Blackboard]

- (1) *Not every blond student passed*
- (2) *Not every student passed*

33

Some logical laws

Quantifier negation

- $\neg \forall x \varphi \Leftrightarrow \exists x \neg \varphi$

Quantifier distribution

- $\forall x(\varphi \wedge \psi) \Leftrightarrow \forall x \varphi \wedge \forall x \psi$

- $\exists x(\varphi \vee \psi) \Leftrightarrow \exists x \varphi \vee \exists x \psi$

Quantifier (in-)dependence

- $\forall x \forall y \varphi \Leftrightarrow \forall y \forall x \varphi$

- $\exists x \exists y \varphi \Leftrightarrow \exists y \exists x \varphi$

- $\exists x \forall y \varphi \Rightarrow \forall y \exists x \varphi$ (but not vice versa)

34

Some logical laws

Quantifier movement

- $\varphi \rightarrow \forall x \psi \Leftrightarrow \forall x(\varphi \rightarrow \psi)$

- $\varphi \rightarrow \exists x \psi \Leftrightarrow \exists x(\varphi \rightarrow \psi)$

- $\forall x \psi \rightarrow \varphi \Leftrightarrow \forall x(\psi \rightarrow \varphi)$

- $\exists x \psi \rightarrow \varphi \Leftrightarrow \exists x(\psi \rightarrow \varphi)$

... provided that x does not occur free in φ

35
