Application Systems for NLG Must be Developed Quickly and in a User-Oriented Way

- **Requirements placed by the application**
 - on the user: recognize and articulate needs
 - on the developer: make herself acquainted with the domain
 - on both: create and adapt a corpus of sample target texts
- **Requirements wrt the software**
 - Adaptability to new tasks and domains
 - Scalability (low costs of the next rule)
 - Modularisation (interpreter, daten, knowledge, interfaces)

High efficiency of development is difficult to achieve with traditional approaches to language generation

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 2

Non-Trivial Generation Systems are Expensive to Adapt to New Domains and Tasks

- **Examples**
 - KPML (Bateman et al.), systemic grammars, development environment
 - FUF/Surge (Elhadad/Robin), functional unification grammar, interpreter
- **Features**
 - large multi-lingual systems
 - detailed, monolingual semantic representations as input
 - broad coverage of linguistic phenomena (goal: the more, the better)
- **Effort for adaptation**
 - Rich interface to the input language of the system (logical form, SPL)
 - Generation of sentences reflecting the distinctions covered

The excellent scope of services of generic resources can often not be utilised in practice

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 3

In Addition to In-Depth NLG, Shallow Approaches are being Pursued

- **In-depth generation**
 - knowledge-based (models of the domain, of the author and the addressees, of the language(s) involved)
 - theoretically motivated, aiming at generic, re-usable technology
 - unresolved issue of general system architecture
- **Shallow generation**
 - opportunistic modelling of relevant aspects of the application
 - diverse depth of modelling, as required by the application
 - some methods viewed as „short cuts“ for unsolved questions of in-depth generation

Shallow generation can be defined in analogy to shallow analysis

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 4

There is a Smooth Transition Between Shallow and Deep Methods

- Prefabricated texts
- „Fill in the slots“
- with flexible templates
- with aggregation
- with sentence planning
- with document planning

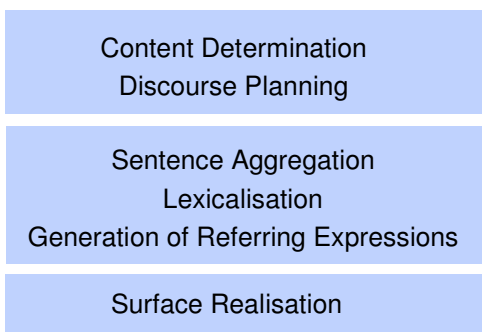

Source: Stephan Busemann

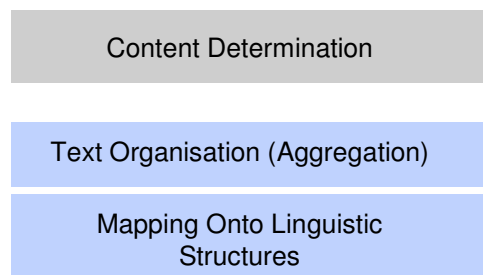

Language Technology I, WS 2008/2009, 5

Shallow Architectures Have a Simple Task Structure

*“In-Depth” model with interaction
(cf. Reiter/Dale 2000)*

*„Shallow“ Model
(Busemann/Horacek 1998)*

Input for Air Quality Report Generation

```
[(COOP threshold-passing)
 (TIME [(PRED season)
        (NAME [(SEASON summer)
                (YEAR 1999)])])]
(POLLUTANT o3)
(SITE "Völklingen-City")
(DURATION [(MINUTE 60)])
(SOURCE [(LAW-NAME bimsch)
          (THRESHOLD-TYPE info-value)])
(EXCEEDS [(STATUS yes)
          (TIMES 1)])]
```

In summer 1999 at the measuring station of Völklingen-City, the information value for ozone – 180 µg/m³ according to the German decree Bundesimmissionschutzverordnung – was exceeded once during a period of 60 minutes.

TG/2 Offers a Flexible Framework for NLG

- TG/2 is a transparent production system
- TG/2 interprets a separately defined set of condition-action rules
- TG/2 maps pieces of input onto surface strings

TG/2 keeps grammars largely independent from input representations

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 11

TG/2 Grammars Integrate Canned Texts, Templates and Context-free Rules

Constraints are Percolated Across the Derivation Tree

- Feature unification (\sqcup) at tree nodes
- Every tree of depth 1 is licensed by a grammar rule
- A feature can be assigned a value ($:=$)
- Two features can be constrained to have identical values ($=$)

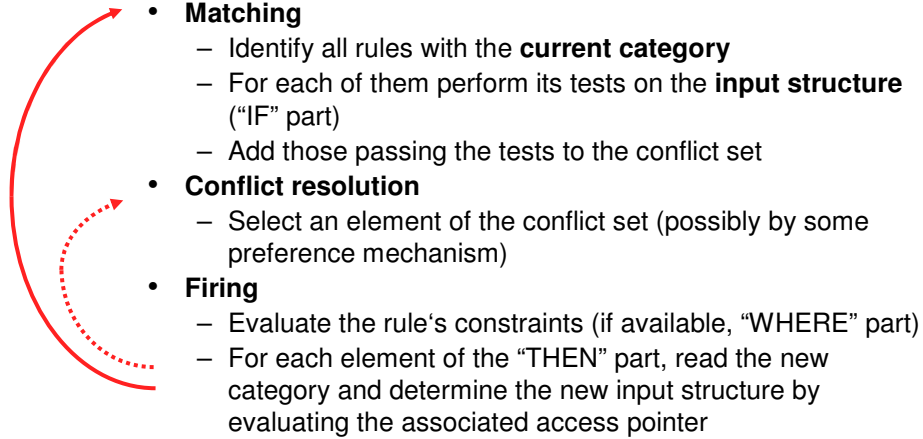

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 16

The Interpreter is Based on the Context-Free Backbone of the Grammars

THREE-STEP EVALUATION CYCLE

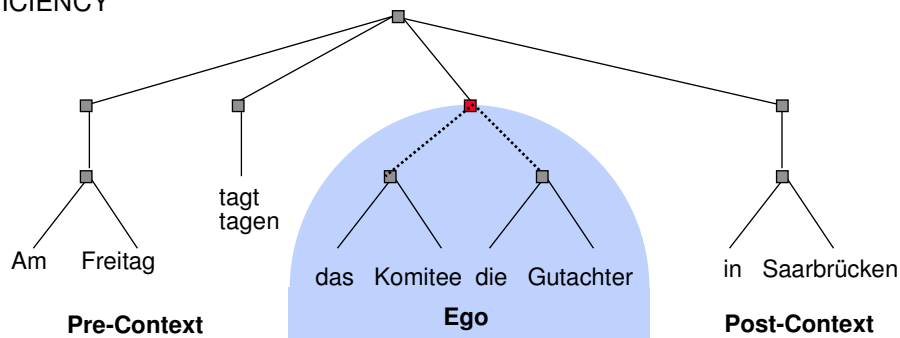

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 17

During Backtracking the Context is Re-Used

EFFICIENCY

- **Pre- and Post-Context remain unchanged (modulo word inflection)**
 - Prerequisite: context-free skeleton of TG/2 Grammars
- **Ego must be generated from scratch every time (modulo memoisation)**

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 18

Each Two Backtrack Nodes Are Either Nested or in Parallel

MULTIPLE SOLUTIONS

	<i>Pre-Context</i>	<i>Ego</i>	<i>Post-Context</i>
B ₁	s ₁	V ₁ = { s _{2i} 1 ≤ i ≤ B ₁ }	s ₃ ·V ₂ ·s ₈
B ₂	s ₁ ·V ₁ ·s ₃	V ₂ = { s _{4j} 1 ≤ j ≤ B ₂ }	s ₈
B ₃	s ₁ ·V ₁ ·s ₃ ·s _{5j}	V ₃ = { s _{6k} 1 ≤ k ≤ B ₂₁ } wobei s _{4j} = s _{5j} ·V ₃ ·s _{7j}	s _{7j} ·s ₈

Text Generation in TEMSIS Occurs in Two Steps

GENERATION SYSTEM OVERVIEW

- **Parameter selection by the user**
 - language (D, E, F, P, C, J)
 - pollutant and measurement station
 - relevant period of time
- **Stage 1: Text schema construction**
 - querying the database
 - composition of report structure
 - elision of contextual redundancies
- **Stage 2: Linguistic realisation by TG/2**
 - selection of sentence patterns
 - wording, phrasing, grammar
- **HTML postprocessing**

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 23

The Texts Vary According to the User's Preferences

EXAMPLE

- **Parameters selected within the TEMSIS Navigator menus:**
 - French text about a German situation
 - ozone data, exceeding thresholds according to decree
 - measurements at Völklingen-City in summer 1997 (to be confirmed)

Vous avez choisi la station de mesure de Völklingen-City afin de consulter la pollution atmosphérique relevée en été 1997.

A la station de mesure de Völklingen-City, la valeur d'information pour l'ozone pour une exposition de 60 minutes (180 µg/m³ selon le décret allemand (Bundesimmissionsschutzverordnung)) a été dépassée une fois.

La valeur d'interdiction du trafic (240 µg/m³) a aussi été dépassée une fois.

En été 1996 la valeur d'information (180 µg/m³) n'a pas été dépassée .

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 24

The Reports Consist of Several Statements

SAMPLE SCHEMA FOR SUMMER OBSERVATION, THRESHOLD PASSING

- **Confirm pollutant, measurement station, and time interval**
- **Number the values exceeding the lowest threshold**
- **Number the values exceeding the next threshold**
- **Compare with values of preceeding year**
- **Repeat the core statement („Summary“)**

A schema is computed on the basis of the input parameters and the retrieved data

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 25

Instantiating a Schema Leads to a Report Structure

TEXT ORGANISATION

- **Achieves text coherence by**
 - removing redundant information
 - inserting particles („also“)
 - simple techniques of aggregating information
- **Yields canned texts or intermediate content representations**
- **Intermediate representations are independent of particular languages**
 - TG/2 generates German, French, English, Portuguese, Chinese and Japanese text from them

Shallow generation can do without explicit knowledge representation and text planning

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 26

Non-Linguistic Input for Air Quality Report Generation in TEMSIS

```
[ (COOP threshold-passing)
  (TIME [ (PRED season)
          (NAME [ (SEASON summer)
                  (YEAR 1999) ] ] )
  (POLLUTANT o3)
  (SITE "Völklingen-City")
  (DURATION [ (MINUTE 60) ] )
  (SOURCE [ (LAW-NAME bimsch)
            (THRESHOLD-TYPE info-value) ] )
  (EXCEEDS [ (STATUS yes)
             (TIMES 1) ] ] ]
```

In summer 1999 at the measuring station of Völklingen-City, the information value for ozone – 180 µg/m³ according to the German decree Bundesimmissions-schutzverordnung – was exceeded once during a period of 60 minutes.

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 27

Multilingual Generation in TEMSIS

- **Grammar size about 100-120 rules**
- **Written with standard text editors (emacs)**
- **Six languages: German, French, English, Chinese, Japanese, Portuguese**
- **Grammar is the only language-specific part** (except for canned texts about pollutants etc and error messages)
- **Adding a new language required little effort: 2-4 weeks, depending on skills** (incl. getting familiar with the system)
- **<http://www.dfki.de/service/nlg-demo>**

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 28

Generated Texts Are Not Invented

CORPUS-BASED GRAMMAR DEVELOPMENT (REITER)

- **User provide examples for target texts - the more, the better**
 - Texts produced manually by domain experts
- **Initial analysis of user-generated corpus**
 - Identify the knowledge used by the authors
 - Clarify with users any underlying semantic and rhetoric relationships
 - Discuss with users how the texts can be improved
- **Analysis of the revised corpus**
 - Definition of linguistic coverage
 - Correlate surface chains and underlying relations
 - Test of revised corpus (Wizard of Oz) and iterate the whole process, if necessary
- **Generalisation from Corpus Samples to Prototypical Examples (Templates)**
 - Basis for shallow grammar development

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 29

Shallow TG/2 Grammars Depend on the Domain

- **Most NLG system cannot cope with varying input**
 - Linguistic vs non-linguistic
 - Course-grained vs fine-grained semantic specifications
- **TG/2 grammars usually are domain-dependent**
 - The input was domain-dependent
 - Grammar development was cheap (~150 rules, ~20 lexemes)
- **In-depth applications require a more generic approach**
 - MUSI IRep4 is a general representation language based on FOL
 - Grammar development had to start before IRep4 was stable
 - Coverage requirements are considerably higher (>800 rules, ~2.000 lexemes)
 - TG/2 grammar editor eGram to improve maintainability

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 30

MUSI Deals with Cross-Lingual Summarisation, Combining Rule-Based and Statistical Techniques

- **“Ideal” approach**
 - conceptual analysis → conceptual summarisation → NL generation
- **Real world situation**
 - Incomplete knowledge, incomplete analysis results,
 - Available technical bases: statistics, cue-phrases, cut-and-paste, concepts
- **MUSI combines different techniques**
 - Filter extracted material based on weighting, cue-phrases and position
 - Deep (conceptual) analysis of the extracted sentences only
 - **The result can be under-specified**
 - Generation of extracted material in target language has to cope with fragmentary input

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 31

Query-Based Summarization

1 TRANS-ESOPHAGEAL ECHOCARDIOGRAPHY IN CRITICAL PATIENTS

Bedside transthoracic and transesophageal echocardiography is a powerful diagnostic tool, in our experience accurate diagnosis can lead to prompt surgical treatment of life threatening lesions like pericardial effusion and tamponade, intra atrial tumor masses, valvular and prosthetic endocarditis, aortic dissection.

Blunt chest trauma may cause many different lesions of the heart and blood vessels: myocardial contusion, traumatic pericarditis, occlusion of a coronary vessel, papillary muscle rupture, inter ventricular septum defect, tricuspid regurgitation, traumatic aortic transection. We describe our experience in emergency area, either in dedicated to cardiac surgery intensive care unit or operative room either in general emergency and intensive care unit.

From 1994 we examined with bedside transthoracic and transesophageal echocardiography patients with blunt chest or thoracic-abdominal trauma and patients with head trauma possible transplant organ donors.

Moreover, since ours is a regional reference Center, we received emergency patients with traumatic lesions from other Hospitals. From January 1st 1994 to October 31st 1996 we examined 158 patients in the General Intensive Care (37 with trauma, 45 transplant organ donors, 5 post cardiopulmonary resuscitation and 71 for miscellaneous); in the same time we accepted 11 patients (7 M) mean age 37 yr.. (12-73) for suspect traumatic lesion of the heart and great vessels. Ten patients were operated; two had pericardial effusion, six underwent aortic surgery with interposition of dacron prosthesis and in one instance repair of aorta-right atrium fistula.

> lesions of the heart?

customisable length,
query-relevance, cue-phrases

<feedback>HIGH RELEVANCE</feedback>
 Bedside transthoracic and transesophageal echocardiography is a powerful diagnostic tool, **in our experience accurate diagnosis** can lead to prompt surgical treatment of life threatening **lesions like pericardial** effusion and tamponade, intra atrial tumor masses, valvular and prosthetic endocarditis, aortic dissection..

Blunt chest trauma may cause many different **lesions of the heart** and blood vessels: myocardial contusion, **traumatic pericarditis**, occlusion of a coronary vessel, papillary muscle rupture, inter ventricular septum defect, tricuspid regurgitation, **traumatic aortic transection**.

Type A aortic dissection patients are accepted on emergency and examined with TEE just after induction of anesthesia to confirm diagnosis and involvement of aortic valve to allow conservative surgery: **the technique is useful** but the possibility of pitfalls **must be considered**.

Source: Stephan Busemann

S 2008/2009, 32

Sentence Extraction is Parameterized by Weights

- **Basic idea: assign each sentence a weight**
 - based on its position and relevance wrt cue phrases or query
- **Select sentences with the highest weights**
 - above a given threshold
 - up to a given number

Computation of the weight for a sentence S

$$\text{weight}(S) = k1 * \text{position}(S) + k2 * \text{cue_phrases}(S) + k3 * \text{query_relevance}(S)$$

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 33

“Protogrammars” Can be Developed Quite Independently of Input Languages

- **Protogrammars are developed for the bookshelf**
 - Application Grammars are derived by defining tests and access functions once an input language definition is available
 - Re-usability is largely increased
- **Protogrammars lack test predicates and access functions**
 - Independent on input
 - One lexeme per PoS and per syntactic subcategory
 - Testable without specific input (except for prohibition of recursion)
- **Protogrammars can be combined in a modular way**
 - Genre dependence
 - Coverage requirements
 - Lexicon

Realization of German Sentences in MUSI

- Size of hand-written grammar: about 950 rules
- Written with standard text editors (emacs), then dedicated editor eGram
- CFGs do not support encoding of word order variation etc.
- Metarule formalism within eGram (Rinck 2003)
- Size of derived grammar about 2.500 rules
- Processing slows down with huge conflict sets
- Take decisions on sentence structure and lexical choice outside of TG/2

Performance loss on backtracking is low

Size of grammars and conflict sets matter

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 42

Overview

Language Technology I, WS 2008/2009, 43

eGram Supports Grammar Development

- Developer-friendly grammar format
- Syntactic and semantic checks of grammar knowledge
- Optionally derive rules from metarules
- Integration with testing by TG/2 and XtraGen

The screenshot shows the eGram 1.4.2 testgram2 application window. The interface includes a menu bar (File, Misc, Help) and several tabs: String-Valued Functions, Access Functions, Meta Rules, Path Variables, Input, Categories, Test Predicates, Features, Rules, Parameters, and Meta-Symbols. On the left, there are several dropdown menus for filtering: Category (All), SVF (All), Test (All), Feature (All), and AccFun (All). Below these is a list of rules with 'Noun Phrase PL' selected. At the bottom left are 'Select All' and 'Select None' buttons. The main area is titled 'Draggable' and contains a 'Show' button and three tabs: 'Documentation', 'XML', and 'Tree'. The 'Documentation' tab is active, displaying the following rule definition:

```
Noun Phrase PL
Category: NP
(AND T2: (equal $get-number pl))
Action:
X1: OPTRULE Det ( get-det:DET )
X2: OPTRULE A ( get-adj:ATTR )
X3: RULE H ( wself: )
X4: " "
Constraints:
C1: X0.CASE = X1.CASE
C2: X0.CASE = X2.CASE
C3: X0.CASE = X3.CASE
C4: X0.NUMBER = X1.NUMBER
C5: X0.NUMBER = X2.NUMBER
C6: X0.NUMBER = X3.NUMBER
C7: X0.PERSON = X3.PERSON
C8: X1.GENDER = X3.GENDER
C9: X2.GENDER = X3.GENDER
C10: X1.DETTYPE = X2.DETTYPE
C11: X0.NUMBER := 'PL'
```

At the bottom right of the main area are buttons for 'New', 'Edit', 'Delete', 'Depend', 'Apply MR', and 'Replace'.

Language Technology I, WS 2008/2009, 44

Declarative Input/Grammar Interface

- XtraGen (Stenzhorn 2002), a Java brother implementation
- eGram (Busemann 2004), a rule editor for TG/2 style grammars, or CFG

```
My category is DECL.  
IF the slot COOP is 'threshold-passing  
  AND the slot LAW-NAME is specified  
THEN apply Pptime from slot TIME  
  apply THTYPE from CURRENT-INPUT  
  utter "("  
  apply LAW from slot LAW-NAME  
  utter ")" "  
  apply EXCEEDS from slot EXCEEDS  
  utter ". "  
WHERE THTYPE AND EXCEEDS agree in GENDER
```

- **Boolean test predicates**
 - To be defined in Lisp and Java
 - Based on built-ins
 - Automatic integration
- **Access pointers**
 - Pathnames rather than functions

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 45

Rule Selection Can Be Guided by Dedicated Conflict Resolution Strategies

- **Processing can be influenced wrt**
 - Selection of the next element of the conflict set
 - Selection of the next backtrack node
- **Conflict resolution strategies are defined by preferences**
 - Preferences correspond to TG/2 rules
 - Preferences can be weighted
- **Incremental generation of the best solution**
 - Based on local decision making
 - “hill-climbing” problem [Nilsson 1980]

Examples for preferences

- Active (rather than passive)
- paratactic style
- German
- indexical (rather than anaphoric) temporal expressions
- formal style
- Expert jargon

Mutual dependencies of criteria can be learned

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 46

Explicit Conflict Resolution in TG/2 is Based on User-Defined Parameters

EXAMPLE: GENERATION OF AIR QUALITY REPORTS

- **Addressees of the air quality reports**
 - Environmental administrations, usually expert users
 - General public, usually novice users
- **Text properties according to corpora**
 - Expert: jargon, technical terms, implicit understanding of relations between e.g. decrees and threshold types
 - Novice: no jargon, circumscribing technical terms, more explicit descriptions

The need for hyperlinks became obvious in either case

Parameter		
Expertise	expert	novice
Hyperlink	yes	no

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 47

Parameterised, Alternative TG/2 Rules Yield Different Texts

- TG/2 Rules are annotated with possible parameter values
- The user decides which values apply
- The conflict resolution procedure prefers those rules, whose annotations correspond best to the user preferences

- Expertise: **expert**
 - In summer 1997, the information value for ozone ($180 \mu\text{g}/\text{m}^3$ according to the German decree Bundesimmissionsschutzverordnung) has been exceeded once.
- Expertise: **novice**
 - Between April and September 1997, the lowest threshold for ozone called information value, which is at $180 \mu\text{g}$ ozone per m^3 air, has been exceeded once.

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 48

Personalized Text Generation

(Busemann 1998)

- **Assign preferences to rules**
- **From a conflict set, preferred rules are selected next**
- **Define hierarchy of preference features**

Assign rules with

Expertise: expert | non-expert

Hyperlink: + | -

User selects non-expert, +

Conflict set {R1, R2, R3}

R1: expert, -

R2: non-expert, -

R3: expert, +

Expertise > Hyperlink -> **R2**

Hyperlink > Expertise -> **R3**

Language Technology I, WS 2008/2009, 49

Overview

- **Motivation**
- **The TG/2 NLG framework**
- **Some major applications**
- **Modifications and extensions**
- **Assessment and conclusions**

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 50

TG/2 is a Single Pass Mapper

- **TG/2 is often combined with other systems**
 - TEMSIS: Text structuring depending on database content; TG/2 generating at paragraph level
 - MUSI: Lexicalization and syntactic choice, avoiding huge conflict sets in TG/2; TG/2 as sentence realizer
- **For interdependencies between subtasks, as in sentence planning, the rule set must spell out all alternatives and quickly becomes unwieldy**

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 51

Shallow Generation Has Pros and Cons

ASSESSMENT

Possible advantages Possible drawbacks

- Low development effort
- Reusable interpreter and subgrammars
- Very fast processing
- Easy introduction of additional languages
- Easy extension with alternative formulations (through a preference mechanism in TG/2)

- Knowledge representation depends on application
- Implicit dependencies
- Scalability is inherently lower than with in-depth generators
- Maintaining transparency of grammars can become a cost factor

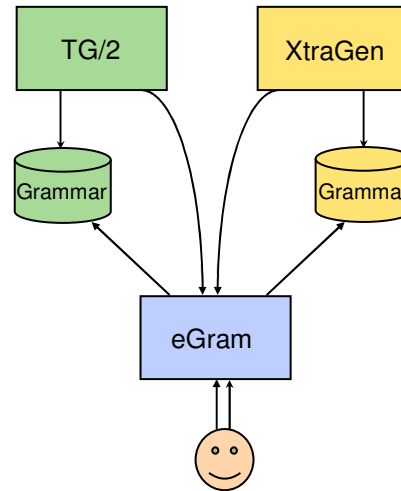

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 52

Conclusions

- TG/2 is a framework that can implement shallow NLG tasks as well as in-depth realization
- Grammar writing for TG/2 and XtraGen is supported by eGram
- TG/2 has been licensed to more than 30 sites for commercial, educational and research purposes

Source: Stephan Busemann

Language Technology I, WS 2008/2009, 53

Questions Answered by Slideset

- **How does shallow generation differ from (standard) in-depth generation?**
- **Give advantages and disadvantages of shallow generation.**
- **How are sample corpora used to ensure the required coverage is available and the correct wordings are generated?**
- **Should an NLG problem be addressed using clause-length pieces of prefabricated text with gaps to be filled during generation? Justify your decision considering both the complexity of the problem and the complexity of the generation process.**
