

# Textual inference: Methods, open source platform and applications

Günter Neumann, January, 2014

The following slides are based on a presentation by Dagan, Magnini, Neumann and Pado held at the “Symposium on Semantic Text Processing - Industrial Outlook Bar-Ilan University, Department of Computer Science, NLP Lab, Nov. 18-19 2014”, cf. <http://u.cs.biu.ac.il/~nlp/workshop14/>

They are accompanied with further additional material.

*EXCITEMENT:*

*EXploring Customer Interactions via TExtual entailMENT*

# Outline

- Entailment recognition algorithm
  - Alignment based
- Entailment knowledge resources
- The EXCITEMENT Open Platform (EOP)
- Entailment graphs

# Alignment-based Entailment Recognition

# Alignment-based Entailment

- Various algorithms proposed to recognize textual entailment
- Recent work in EXCITEMENT: Alignment-based entailment
- Intuition: The more material in the hypothesis can be “explained” / “covered” by the premise, the more likely entailment is

P: Peter was Susan's husband

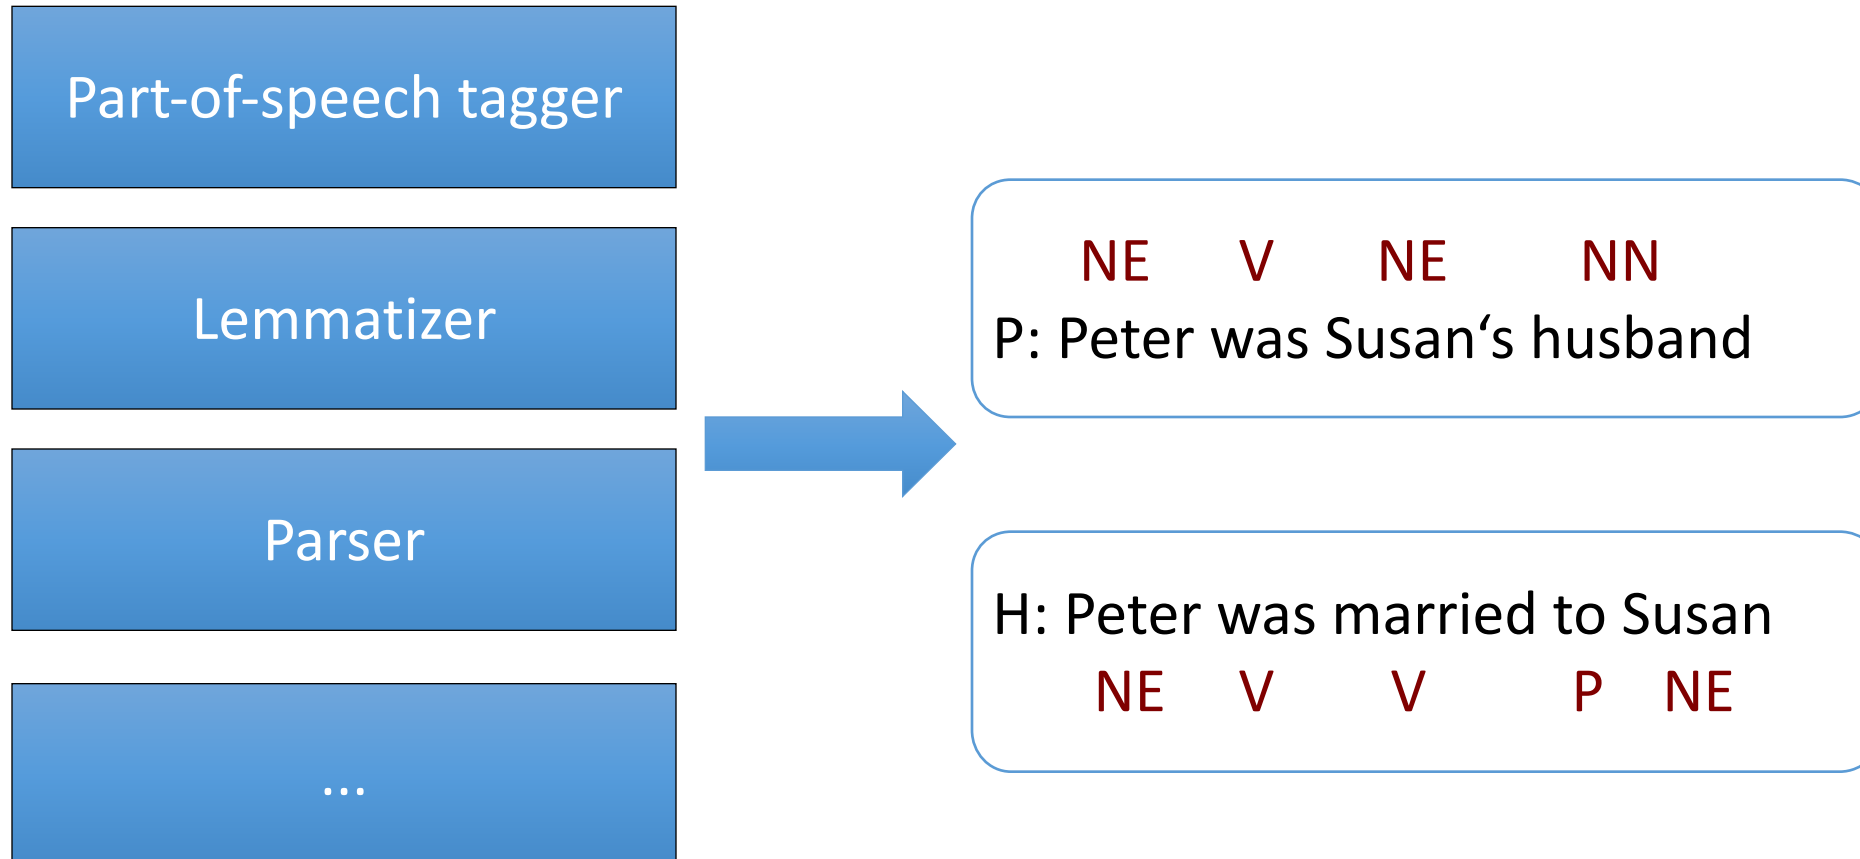

H: Peter was married to Susan

P: Peter did not know Susan

H: Peter was married to Susan

# Alignment-based Entailment: The Algorithmic Level

- **Step 1:** Automatic linguistic analysis (Optional)
  - Normalize surface forms, detect structure

# Alignment-based Entailment: The Algorithmic Level

- **Step 2:** Identify links between words or phrases across the two texts
  - What words/phrases of P can explain words/phrases of H?

# Lexical and Paraphrase Alignment Resources

- Broad-coverage knowledge needed to align words/phrases
  - Align identical words
  - Align lexically related **words**:  
use lexical resources  
(WordNet, distributional similarity)
  - Align equivalent/related **phrases**:  
use paraphrase resources

Peter → Peter

dog → mammal  
Paris → France

was → used to  
husband → married to

# Alignment-based Entailment: The Algorithmic Level

- **Step 3:** Computation of features over alignment
  - Formulate features that capture typical properties of valid entailments

P: Peter was not married to Susan

H: Peter was married to Susan

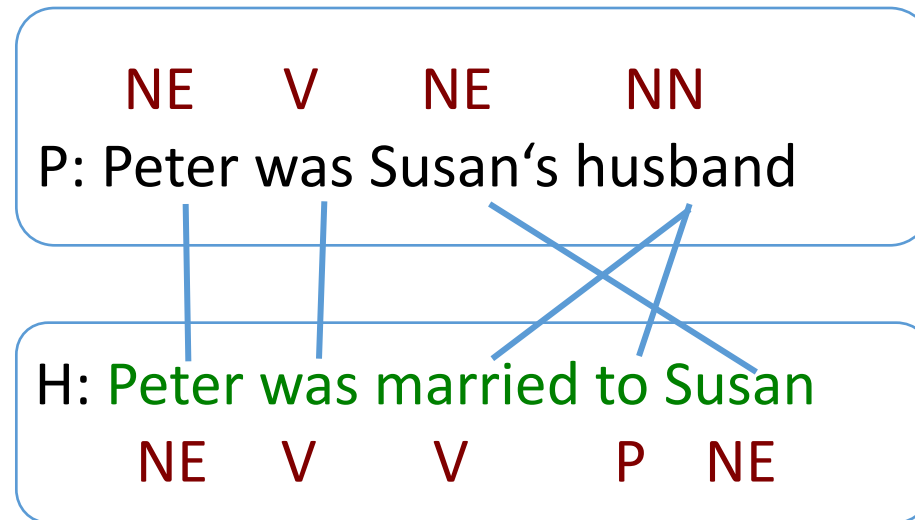

# Concrete features

- Current implementation uses just four simple features
- **Word coverage:** What % of hypothesis words is covered?
- **Content word coverage:** What % of content words (N,V, A) covered?
- **Verb coverage:** What % of verbs is covered?
  - Verbs express the relations
- **Proper Noun coverage:** What % of proper nouns is covered?
  - Proper nouns express participants, typically require explicit mentions
- More features under development
  - E.g compatibility of negations

# Alignment-based Entailment: The Algorithmic Level

- **Step 3:** Computation of features over alignment

Word Coverage:  $5/5 = 100\%$

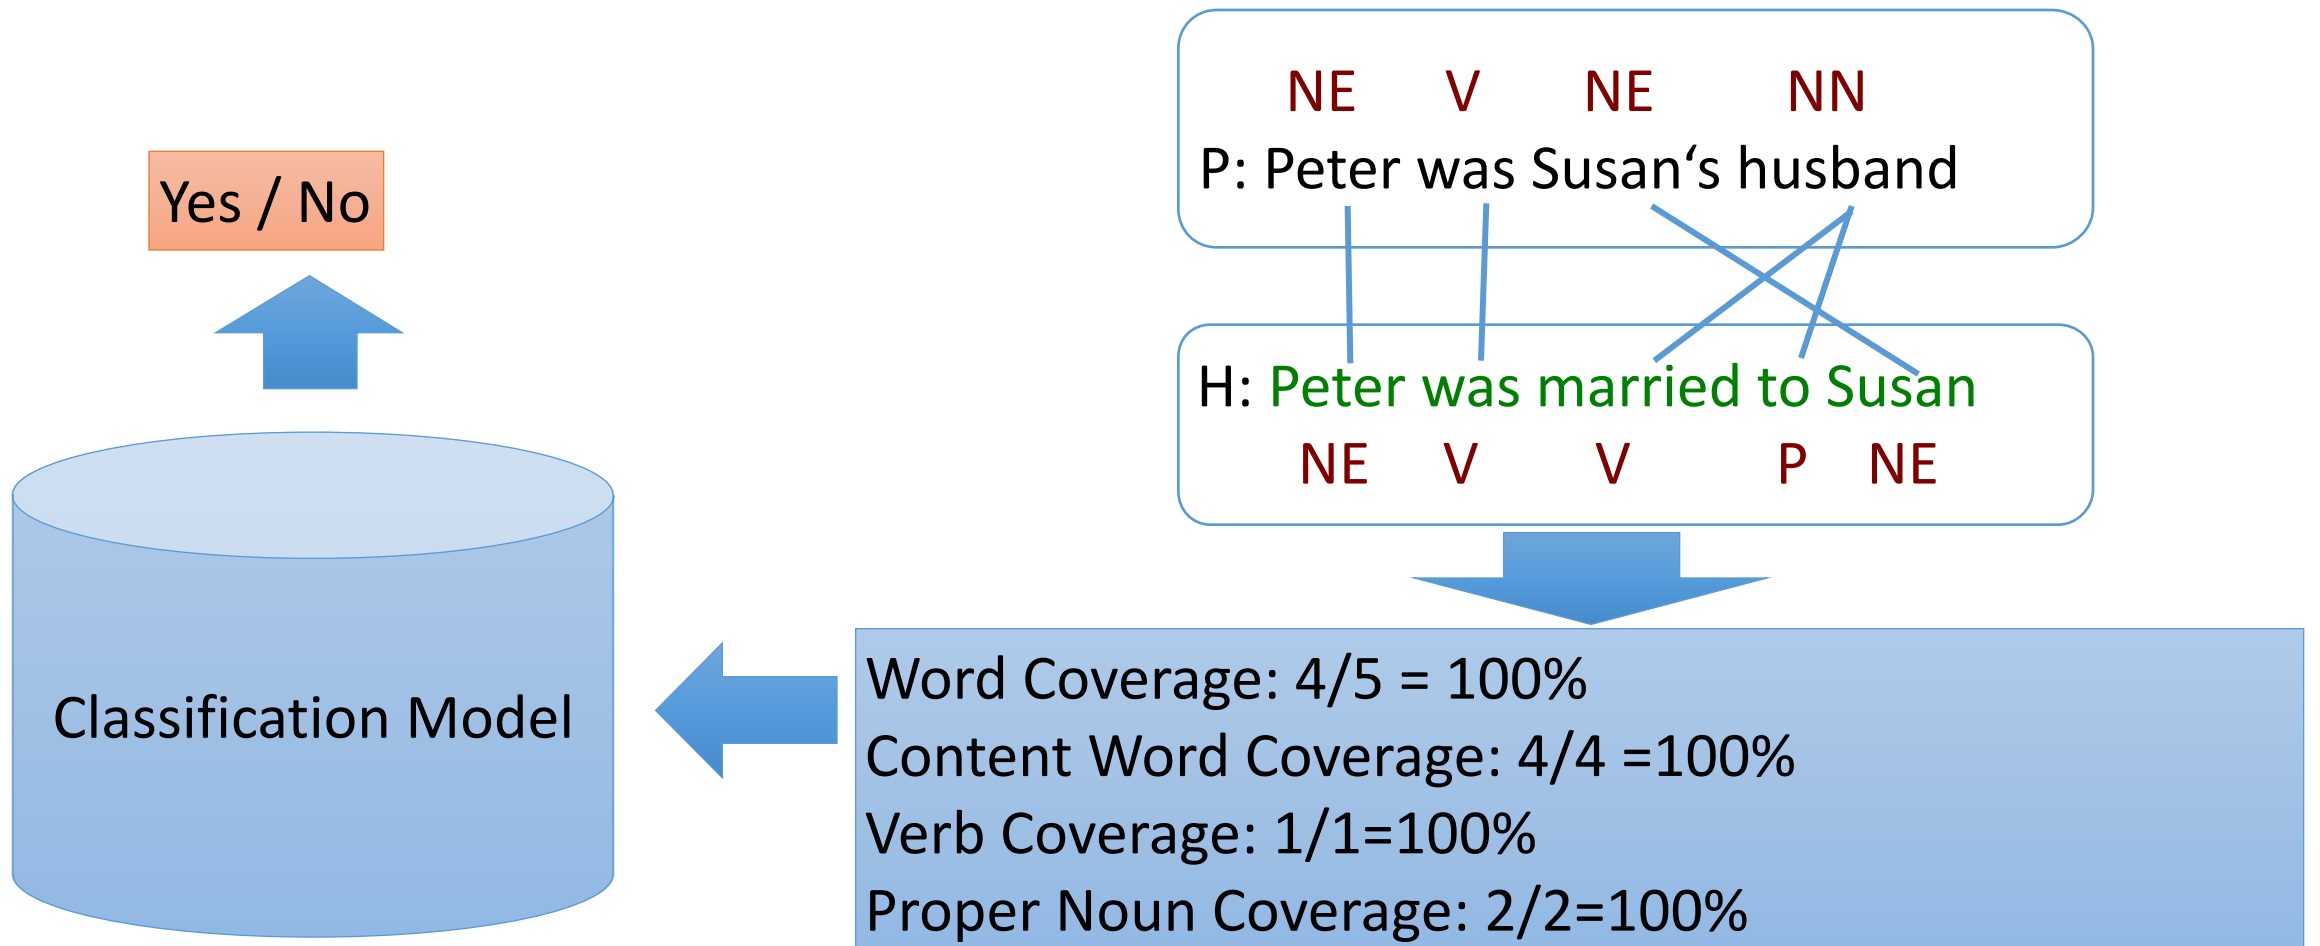

Content Word Coverage:  $4/4 = 100\%$

Verb Coverage:  $1/1 = 100\%$

Proper Noun Coverage:  $2/2 = 100\%$

# Alignment-based Entailment: The Algorithmic Level

- **Step 4:** Classification (logistic regression, with training examples)

# Why Alignment-based Entailment Recognition?

- Efficient
- (Almost completely) language-agnostic
- Robust: Can deal with noisy input data
  - Shallow linguistic cues
- Adaptable to new domains
  - Encode domain knowledge as alignment resource
- **Extensible**
- **State of the art useful accuracy**
  
- Will be included in EOP release in December 2014

# Why Alignment-based Entailment Recognition?

# Entailment Knowledge Resources

# Various Resources Types

- Wordnet
  - *pepper* → *spice*   *stock* → *share*
- Derivational morphology
  - *allergenic* → *allergy*   *acquire* → *acquisition*
- Corpus-based distributional similarity
  - As seen in tutorial
  - Similar to word2vec type of output; limited correlation with entailment/equivalence
  - *Directional* similarity, usually somewhat better
- Wikipedia derived
  - *Madonna* → *singer*
- Paraphrasing – bilingual based

Tools for constructing knowledge resources for domain corpora and languages

# Extraction from Wikipedia

(Shnarch et al., 2009)

## E.T. the Extra-Terrestrial

From Wikipedia, the free encyclopedia

(Redirected from [E.T. film](#))

***E.T. the Extra-Terrestrial*** is a 1982 [science fiction](#) [film](#) co-produced and directed by [Steven Spielberg](#), written by [Melissa Mathison](#) and starring [Henry Thomas](#), [Robert MacNaughton](#), [Drew Barrymore](#), [Dee Wallace](#) and [Peter Coyote](#). It tells the story of Elliott (played by Thomas), a lonely boy who befriends a friendly [alien](#) dubbed "E.T.", who is stranded on [Earth](#). Elliott and his [Extraterrestrial life](#)

• *Be-complement*

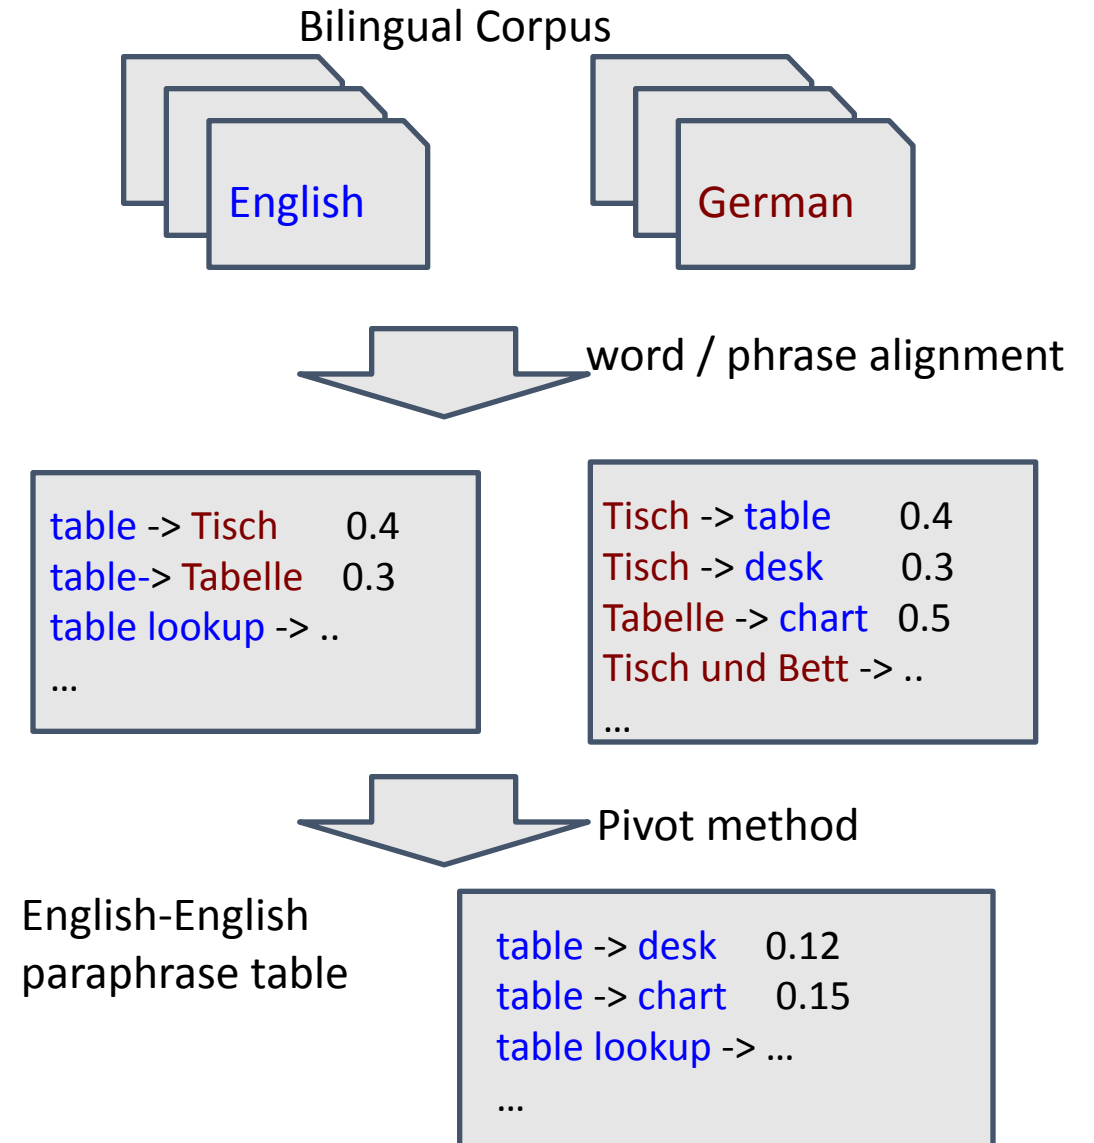

• *Redirect*

• *Parenthesis*

• *Link*

# Bilingual-based Paraphrases

- Intuition:  $p$  and  $p'$  are paraphrases if both translate into same phrase  $t$  (a “pivot”)
- Procedure:
  1. Word- and phrase-align parallel corpus (e.g. English-German)
  2. Extract bilingual translation table
  3. Hop from English to German and back to obtain paraphrase table (plus probability)

# Transformation-based Approach

# Recognizing Entailment via Sequences of Transformations

- Sequence of transformations
- Tree-Edits
  - Complete proofs
  - Estimate confidence
- Knowledge based Entailment Rules
  - Linguistically motivated
  - Formalize many types of knowledge

# Recognizing Entailment via Sequences of Transformations

- Sequence of transformations

$$T = T_0 \rightarrow T_1 \rightarrow T_2 \rightarrow \dots \rightarrow T_n = H$$

- Tree-Edits
  - Complete proofs
  - Estimate confidence
- Knowledge based Entailment Rules
  - Linguistically motivated
  - Formalize many types of knowledge

# Example

**Text:** The boy was located by the police.

**Hypothesis:** Eventually, the police found the child.

**Hypothesis:** Eventually, the police found the child.

# Recognizing Entailment as a Scientific Competition

# Recognizing Textual Entailment (RTE) Challenge – A Scientific Competition

- Since 2005 until today - RTE-1 to RTE-7
- Main motivation: Bring together scientists from all over the world, in order to commonly push forward the scientific field of „applied semantics“ („open collaboration“).

Information Technology Laboratory  
**Text Analysis Conference**

NIST  
National Institute of Standards and Technology

**TAC 2011 Workshop**  
<http://www.nist.gov/tac/2011/workshop/>  
November 14-15, 2011  
National Institute of Standards and Technology  
Gaithersburg, Maryland USA

Conducted by:  
U.S. National Institute of Standards and Technology (NIST)

With support from:  
U.S. Department of Defense

The Text Analysis Conference (TAC) is a series of evaluations and workshops organized to encourage research in Natural Language Processing and related applications, by providing a large test collection, common evaluation procedures, and a forum for organizations to share their results. TAC comprises multiple tracks, each of which focuses on a particular subproblem of NLP. TAC tracks aim to improve performance on end-user tasks, but also include diagnostic and component evaluations situated within the context of end-user tasks.

All are invited to participate in the TAC 2011 workshop in Gaithersburg, Maryland, where results of the TAC 2011 track evaluations will be reported and discussed. TAC 2011 has three tracks:

- 1. Knowledge Base Population**  
The goal of the KBP track is to promote research in automated systems that discover information about named entities as found in a large corpus and incorporate this information into a given knowledge base (namely, a KB derived from Wikipedia). The KBP track comprises the following tasks:
  - Entity-Linking Task: Given a name (of a Person, Organization, or Geopolitical Entity) and a document containing that name, determine the KB node for the named entity, adding a new node for the entity if it is not already in the KB. Two variants of the entity-linking task are offered: English-only, and cross-lingual (both English and Chinese documents).
  - Slot-Filling Task: Given a named entity and a pre-defined set of attributes ("slots") for the entity type, augment a KB node for that entity by extracting all new learnable slot values for the entity as found in a large corpus of documents.
  - Temporal Slot-Filling Task: Similar to the regular slot-filling task, but also specify time intervals for each extracted slot value. In addition to a full temporal slot-filling task, a diagnostic temporal task is offered, in which systems are provided with documents and correct slot values and only have to specify the temporal information.
- 2. Recognizing Textual Entailment**  
The goal of the RTE Track is to develop systems that recognize when one piece of text entails another. RTE-7 pursues the direction of recognizing entailment in larger contexts -- a whole document or set of documents. RTE-7 comprises the following tasks:
  - Main and Novelty-Detection Tasks: Determine whether a given sentence -- in the context of an entire document -- entails a given Hypothesis.
  - Knowledge Base Population Validation Task: Determine whether a given document entails a given TAC KBP relation (e.g., "X is married to Y").
- 3. Summarization**  
The goal of the Summarization Track is to develop systems that produce coherent summaries of text. The Summarization track comprises the following tasks:
  - Guided Summarization Task: Produce short, coherent summaries of news articles falling into predefined categories, guided by predefined aspects for each category.
  - Automatically Evaluating Summaries of Peers (AESOP) Task: Automatically score a summary for a given metric, including content (Pyramid score), overall responsiveness, and overall readability.
  - Multiling Pilot: Develop and apply partially or fully language-independent summarization algorithms to multiple languages, including Arabic, Czech, English, French, Greek, Hindi, and Hebrew.

The workshop will include presentation of results for each of the TAC 2011 tracks (including failure analyses and system comparisons), as well as more lengthy system presentations describing techniques used, experiments run on the data, and other issues of interest to researchers in NLP.

# Differences between RTE-1-5 and RTE-6-7

## RTE1-5 vs. RTE6 Main Task

### RTE1-5

- RTE on isolated T-H pairs
- T-H pairs drawn from multiple applications
- T and H do not contain references to information outside the pair itself
- The distribution of entailment is determined a priori

### RTE6

- RTE within a corpus
- Summarization application setting
- Both T and H are to be interpreted within the context of the corpus
- Reflects the natural distribution of entailment in a corpus

# Data format for RTE-1-5

```
<pair id="1" entailment="YES" task="IE" length="short" >
<t>The sale was made to pay Yukos' US$ 27.5 billion tax bill, Yuganskneftegaz was originally sold for
US$ 9.4 billion to a little known company Baikalfinansgroup which was later bought by the Russian
state-owned oil company Rosneft .</t>

## RTE-6 Main Task Example

### Topic 918: Betty Friedan

Hs SET

**H380** :Betty Friedan is the author of "The Feminine Mystique."

**H391** : "The Feminine Mystique" was published in 1963.

**H401** : In 1962, Judy Mott was laid off from her job with Sears.

#### Document 1

S1: Betty Friedan, a founder of the modern feminist movement in the United States, died here Saturday of congestive heart failure, feminist leaders announced.

S2: She was 85.

S3: Friedan achieved prominence in 1963 with the publication of her book "The Feminine Mystique," which detailed the lives of American women who were expected to find fulfillment through the achievements of their husbands and children.

S4: The book sparked a movement for a re-evaluation of women's role in American society and is credited with laying the foundation of modern feminism.

S5: She was a founder of the National Organization for Women and a leading advocate of the Equal Rights Amendment, a proposed amendment to the US constitution banning sex-based discrimination, women's rights activists said.

S6: "The movement that Friedan's energy sparked continues to grow, and is bigger today than she could ever have dreamed ...

...

#### Document 2

S1: Betty Friedan, the visionary, combative feminist who launched a social revolution with her provocative 1963 book, "The Feminine Mystique," died Saturday, which was her 85th birthday.

S2: Friedan died of congestive heart failure at her home in Washington, D.C., according to Emily Bazelon, a cousin who was speaking for the family.

S3: She said Friedan had been in failing health for some time.

S4: Her best-selling book identified "the problem that has no name," the unhappiness of post-World War II American women unfulfilled by traditional notions of female domesticity.

S5: Melding sociology and humanistic psychology, the book became the cornerstone of one of the last century's most profound movements, unleashing the first full flowering of American feminism since the 1800s.

S6: It gave Friedan, an obscure suburban New York housewife and freelance writer, the mantle to ...

...

#### Document 3

S26: What is perhaps most surprising, though, is not that feminists like Hirschman believe homemaking is second-class drudgery, but that so many people still get worked up over the issue.

S27: After all, feminist thinkers have been proclaiming the need to free women from the bondage of housework for a long time.

S28: It is, as Hirschman freely acknowledges, precisely what Friedan argued in "The Feminine Mystique," first published more than 40 years ago.

S29 "The only kind of work which permits an able woman to realize her abilities fully," Friedan wrote, "is the kind that was forbidden by the feminine mystique, the lifelong commitment to an art or science, to politics or profession."

S30: Not homemaking, not motherhood.

S31: In an interview, Hirschman said that in the course of researching a book, she began to wonder when feminists switched from offering a clear blueprint for liberation to choosing from Column A and Column B.

...

# Example system - DFKI-LITE - RTE-7

- A single machine learning engine (a linear SVM) is fed with features extracted from many different sources and learns to select the best (Volokh & Neumann, 2011).
- **It also uses METEOR as text aligner!**

## Main Task Evaluation

13 participants (33 runs)

- Evaluation measures:
  - Precision, Recall, F-measure (micro-averaged)
- IR Baselines:

	Precision	Recall	F1
Lucene_5	37.00	37.84	37.41
Lucene_10	27.07	55.20	36.33
Lucene_15	21.15	64.65	31.85
Lucene_20	17.71	71.64	28.40
Lucene_100	5.83	100	11.02

NIST - November 14, 2011

RTE-7@TAC2011

- 43.41 micro-average F1-score
- 46.34 macro-average F1-score
  - Above median, big improvement over the last year
- Very robust solution to an extremely large amount of data
  - >50% can be solved this way if account for weaknesses
- Problem-specific alternatives can still be included for the rest of the data

## Best Results

Team	Precision	Recall	F-measure

# EOP

Excitement Open Platform For Recognizing Textual Entailment

View project on  [GitHub](#)

---

## // Introduction

The Excitement Open Platform (EOP) is a generic architecture and a comprehensive implementation for textual inference in multiple languages. The platform includes state-of-art algorithms, a large number of knowledge resources, and facilities for experimenting and testing innovative approaches. The EOP is one of the main outcomes of the project [EXCITEMENT - Exploring Customer Interactions through Textual Entailment](#). The Platform includes readily-available [Recognizing Textual Entailment \(RTE\)](#) technology, and a modular architecture for text preprocessing, entailment engines and several knowledge resources. The current EOP version covers three languages (i.e. English, German, Italian) and includes tools for creating new resources in other languages. The EOP has been designed to be used in several research [use cases](#) and its [distribution package](#) provides a number of utilities.

---

## // Recognizing Textual Entailment

Textual Entailment is a directional relation between text fragments. Given two text fragments, one named Text (T) and the other named Hypothesis (H), the Recognizing Textual Entailment task consists in recognizing whether the Hypothesis can be inferred from the Text. We use a graduated definition of entailment: T entails H ( $T \rightarrow H$ ) if, typically, a human reading T would infer that H is most likely true. The following is an example of positive entailment:

- Text: If you help the needy, God will reward you.
- Hypothesis: Giving money to a poor man has good consequences.

More on Recognizing Textual Entailment can be found at the [ACLWiki Textual Entailment Portal](#).

---

## // Architecture

```
graph TD; Input[T-H pairs] --> LAP[Linguistic Analysis Pipeline (LAP)]; LAP --> EDA[Entailment Decision Algorithms (EDA)]; EDA --> Output[Decision]; subgraph LAP_Resources [Linguistic Analysis Pipeline (LAP) Resources]; WordNet; Wikipedia; SyntacticRules[Syntactic Rules]; end; LAP_Resources --> LAP;
```

The EOP takes T-H pairs as input and the output is an entailment judgement, represented by "Entailment" if T entails H, or "NonEntailment" if the relation does not hold. The EOP architecture is based on the concept of modularization with pluggable and replaceable components to enable extension and customization.

The Linguistic Analysis Pipeline (LAP) is a collection of annotation components for Natural Language Processing (NLP) where component integration is based on the Apache UIMA framework. It enables interoperability among components while ensuring language independence.

The **EXCITEMENT Open Platform (EOP)** is a generic architecture and a comprehensive implementation for textual inference in multiple languages. The platform includes state-of-art algorithms, a large number of knowledge resources, and facilities for experimenting and testing innovative approaches.

### Major changes of release 1.2.0 compared to the previous release 1.1.4

#### New Features:

- P1EDA (alignment-based EDA) – this EDA tries to align T with H, according to different aspects of their representation: lexical, syntactic, etc. It eventually classifies whether or not T entails H by considering the plausibility of those alignments.
- LAP for Bulgarian language.

#### Bug Fixes:

- Wrong Ant build script and documentation for installing TreeTagger.

## EOP

Excitement Open Platform For Recognizing Textual Entailment

### Introduction

The Excitement Open Platform (EOP) is a generic architecture and a comprehensive implementation for textual inference in multiple languages. The platform includes state-of-art algorithms, a large knowledge resources, and facilities for experimenting and testing innovative approaches. The one of the main outcomes of the project **EXCITEMENT - EXploring Customer Interactions in Textual Entailment**. The Platform includes ready-available **Recognizing Textual Entailment (RTE)** technology, and a modular architecture for text preprocessing, entailment engines and several knowledge resources. The current EOP version covers three languages (i.e. English, German, and includes tools for creating new resources in other languages). The EOP has been designed in several research use cases and its distribution package provides a number of utilities.

### Recognizing Textual Entailment

Textual Entailment is a directional relation between text fragments. Given two text fragments, named Text (T) and the other named Hypothesis (H), the Recognizing Textual Entailment task is recognizing whether the Hypothesis can be inferred from the Text. We use a graduated definition: T entails H (T  $\rightarrow$  H) if, typically, a human reading T would infer that H is most likely following is an example of positive entailment:

- Text: If you help the needy, God will reward you.
- Hypothesis: Giving money to a poor man has good consequences.

More on Recognizing Textual Entailment can be found at the [ACLWiki Textual Entailment Page](#)

### Architecture

The EOP takes T-H pairs as the input and produces an entailment result represented by "Entailment" if it holds, "NonEntailment" if it does not hold. The EOP architecture is based on the concept of modular pluggable and replaceable components to enable extension and customization.

The Linguistic Analysis Pipeline is a collection of annotation tools for Natural Language Process where component integration on the Apache UIMA framework enables interoperability between components while ensuring independence.

```
graph TD
    Input[T-H pairs] --> LAP[Linguistic Analysis Pipeline (LAP)  
Tokenizing, POS Tagging, Dependency Parsing...]
    LAP --> EDA[Entailment Decision Algorithms (EDA)]
    EDA --> Output[Entailment / NonEntailment]
```

# Open Source Distribution of EOP

- Quick Code Integration
  - Git, Github, Maven, Jenkins
- Quality Control
  - Code quality tools (e.g. check style, find bugs)
- Additional Highlights
  - Archive for Experiments
  - GitHub wiki pages (release-specific documentation)
  - Two Distributions: API and Command Line Interface
- License: General Public License (GPL) version 3

# Overview – Release Management

- Keeping several code versions (master branch, releases)
- Automatic methods for
  - creating new releases and resource distributions
  - maintenance of release-specific documentation
  - Generating Web Page (EOP web site)
- Separate documentations for end users and developers

# EOP in Numbers (08/09/2014)

- EOP GitHub repository:
  - 52 Members (people who forked the EOP Repository)
- Mailing lists:
  - developers: 21
  - users: 24 (12 external users)
- EOP v1.1.3
  - Downloads: 77
  - Experiments Archive: 13 experiments
    - 96 experiments in the current developers version EOP v1.1.5
  - Download + Installation: 10 min by a shell script

# Building Entailment Graphs

# Customer Interactions Scenario

## ***Int-448:***

Efficient service. Quick through security and check in. Staff could have been a bit more friendly though and leg room in standard class was quite poor.

## ***Int-202:***

Everything ran smoothly and well. Only complaint is lack of leg room with seating with tables. Very cramped when all seats are taken.

## ***Int-275:***

The leg room in economy class is not enough I was constantly being kicked by opposite passenger I travel by train lots and this compares badly to other trains

## ***Int-303:***

My only gripes, not enough leg room in standard and I think it would be chic to have refreshments served in carriages , either trolley or trays like in theatres .

# EXCITEMENT application scenario

## Requirements

- Need for customer interaction analytics
  - **Compact** representation (show just relevant information)
  - **Informative** representation: general categories (e.g. “food”, “internet”) are not enough
- Need to manage streams of data
- Multiple channels: e-mail, speech, social media
- Noisy data: automatic transcriptions, social media style, etc.
- Multiple languages
  - Excitement: English, Italian, German

## Challenge

- Core technology: entailment graphs based on the EOP platform
- Current experiments based on the Alignment-based algorithm

# Extracting Fragments from Interactions

*TOPIC: Reasons for dissatisfaction in railway service*

*Int-448:* Efficient service. Quick through security and check in. But **leg room in standard class was quite poor.**

*Int-202:* Everything ran smoothly and well. Only complaint is **lack of leg room with seating with tables.**

*Int-275:* **Seating is very cramped** – my journey has been very uncomfortable with the person next to me taking up most of the space we have.

*Int-303:* My only gripes r **not enough leg room in standard** and I think it would be chic to have refreshments served in carriages , either trolley or trays like in theatres .

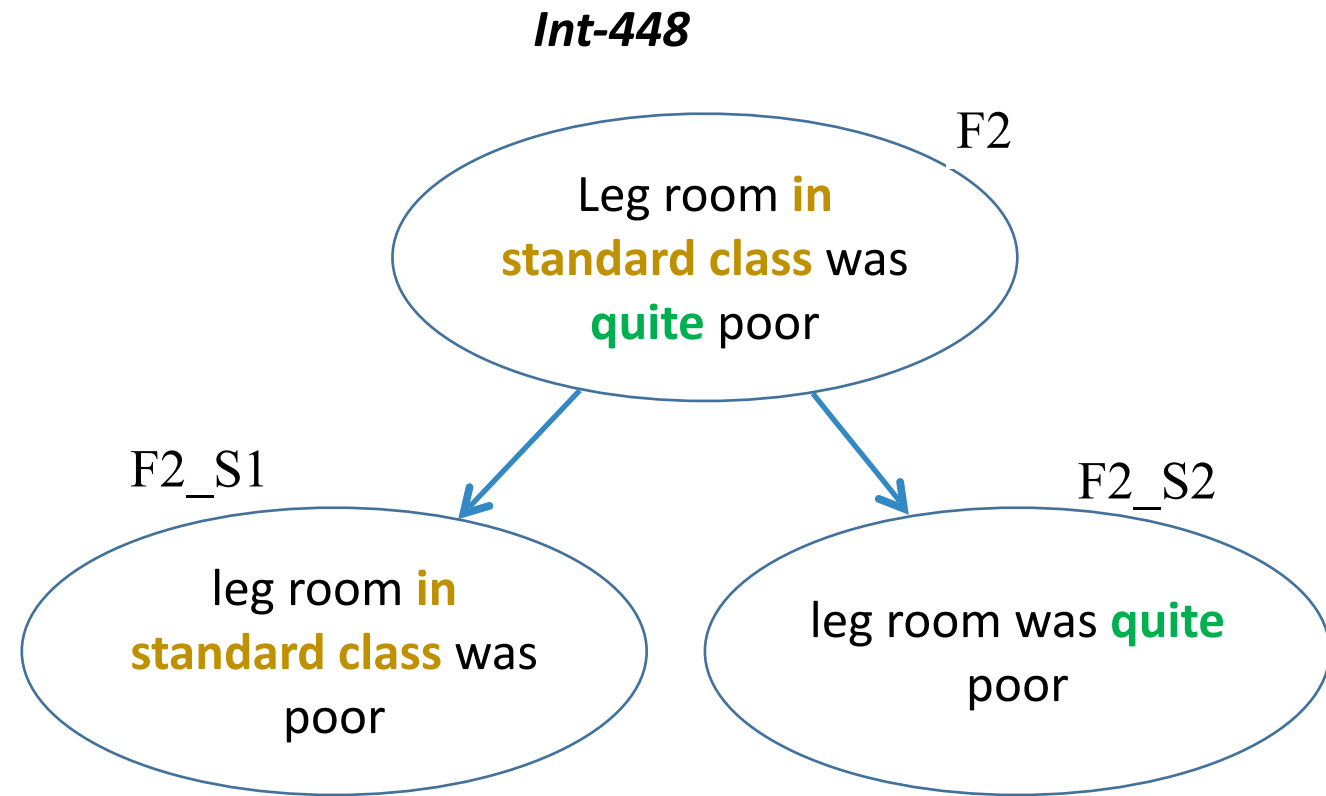

# Building Fragment Graphs

*Int-448*

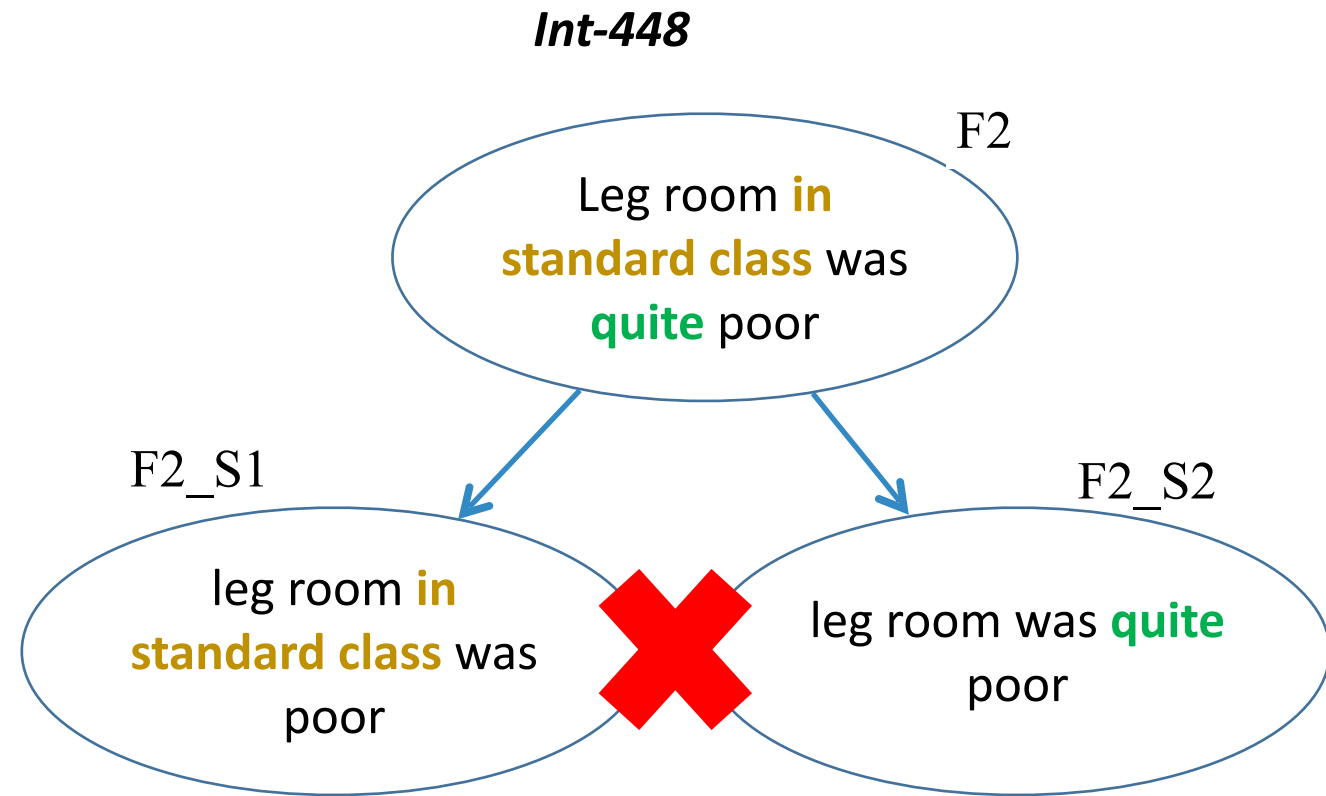

F2

Leg room **in**  
**standard class** was  
**quite** poor

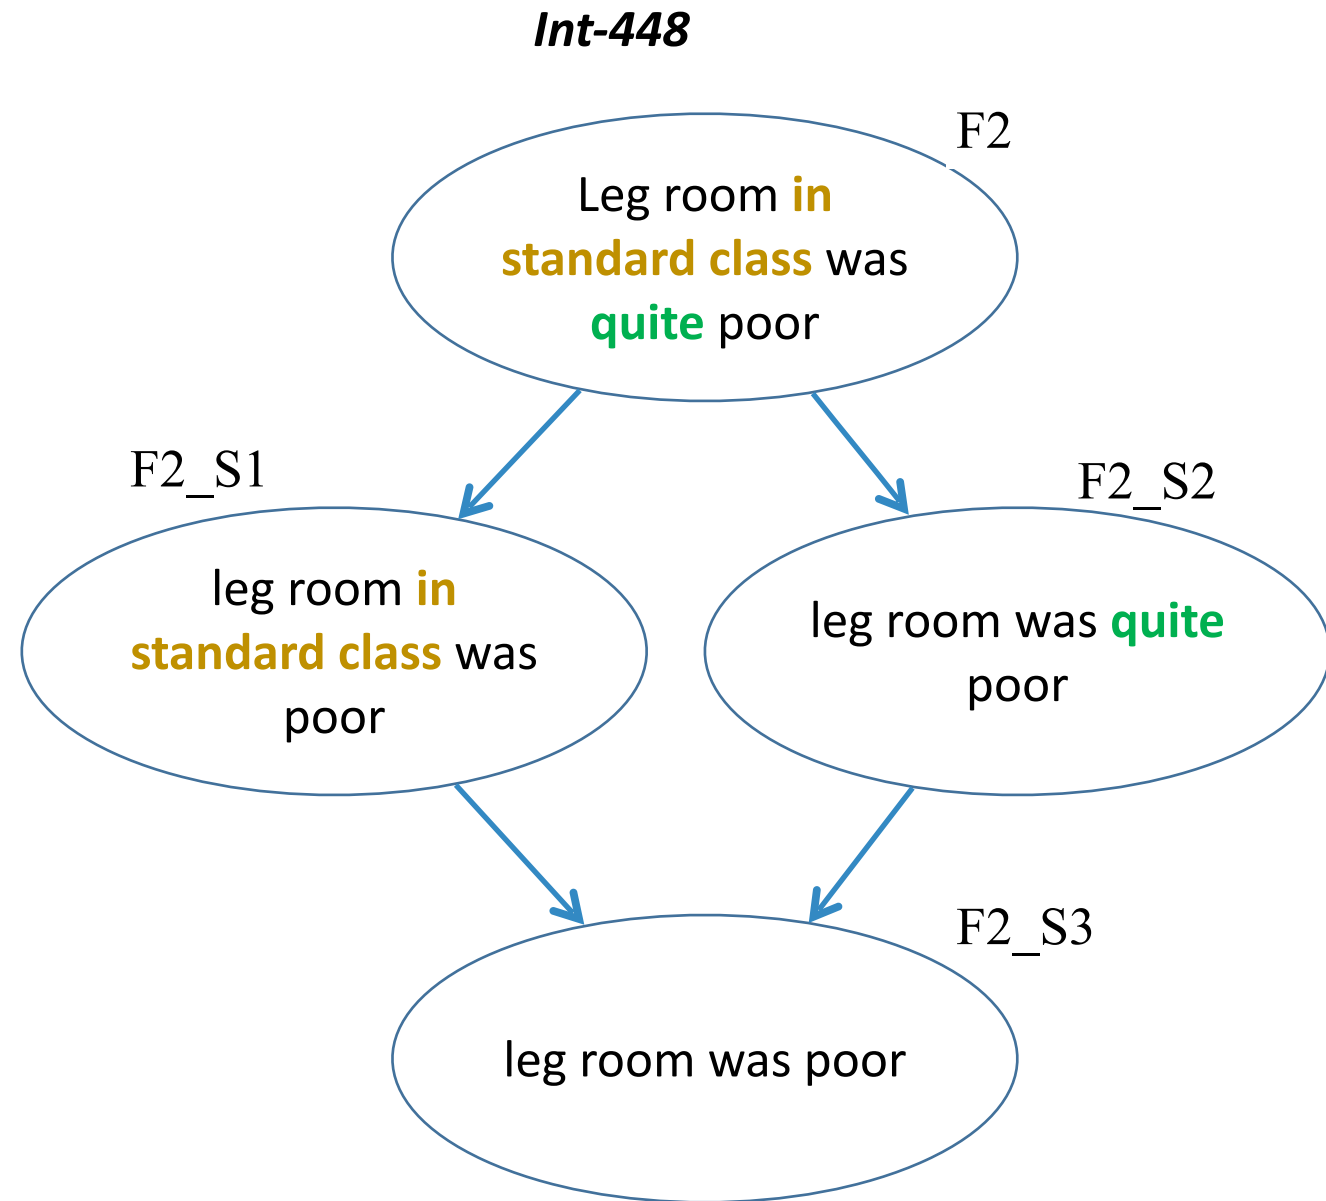

# Building Fragment Graphs

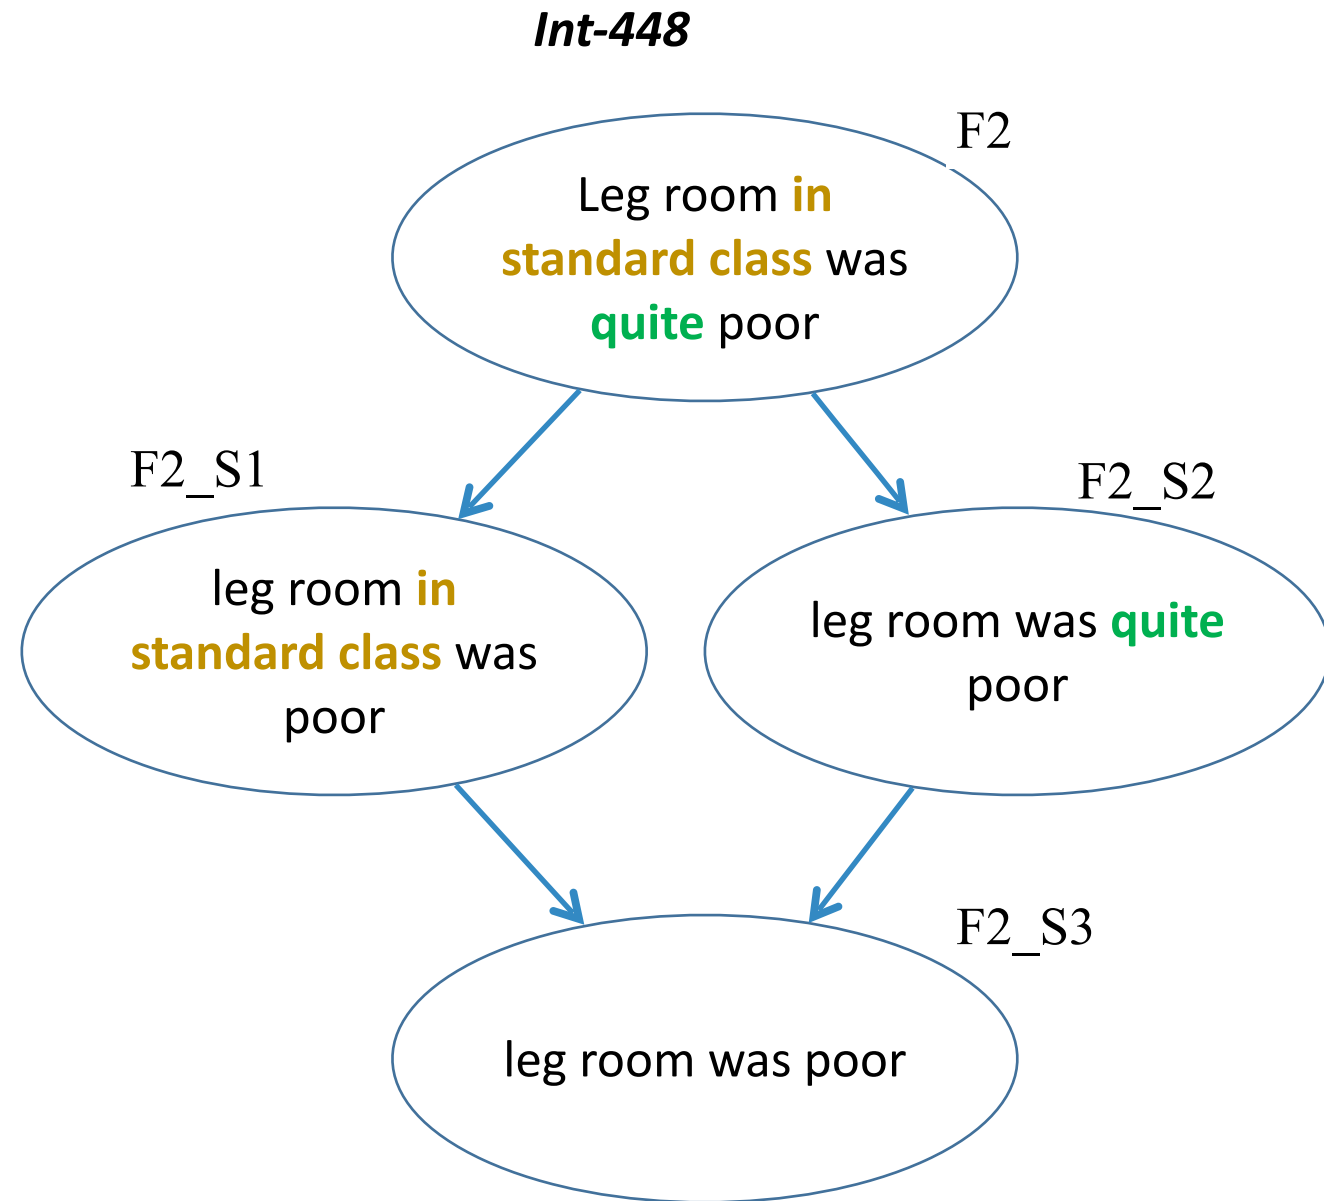

# Building Fragment Graphs

# Building Fragment Graphs

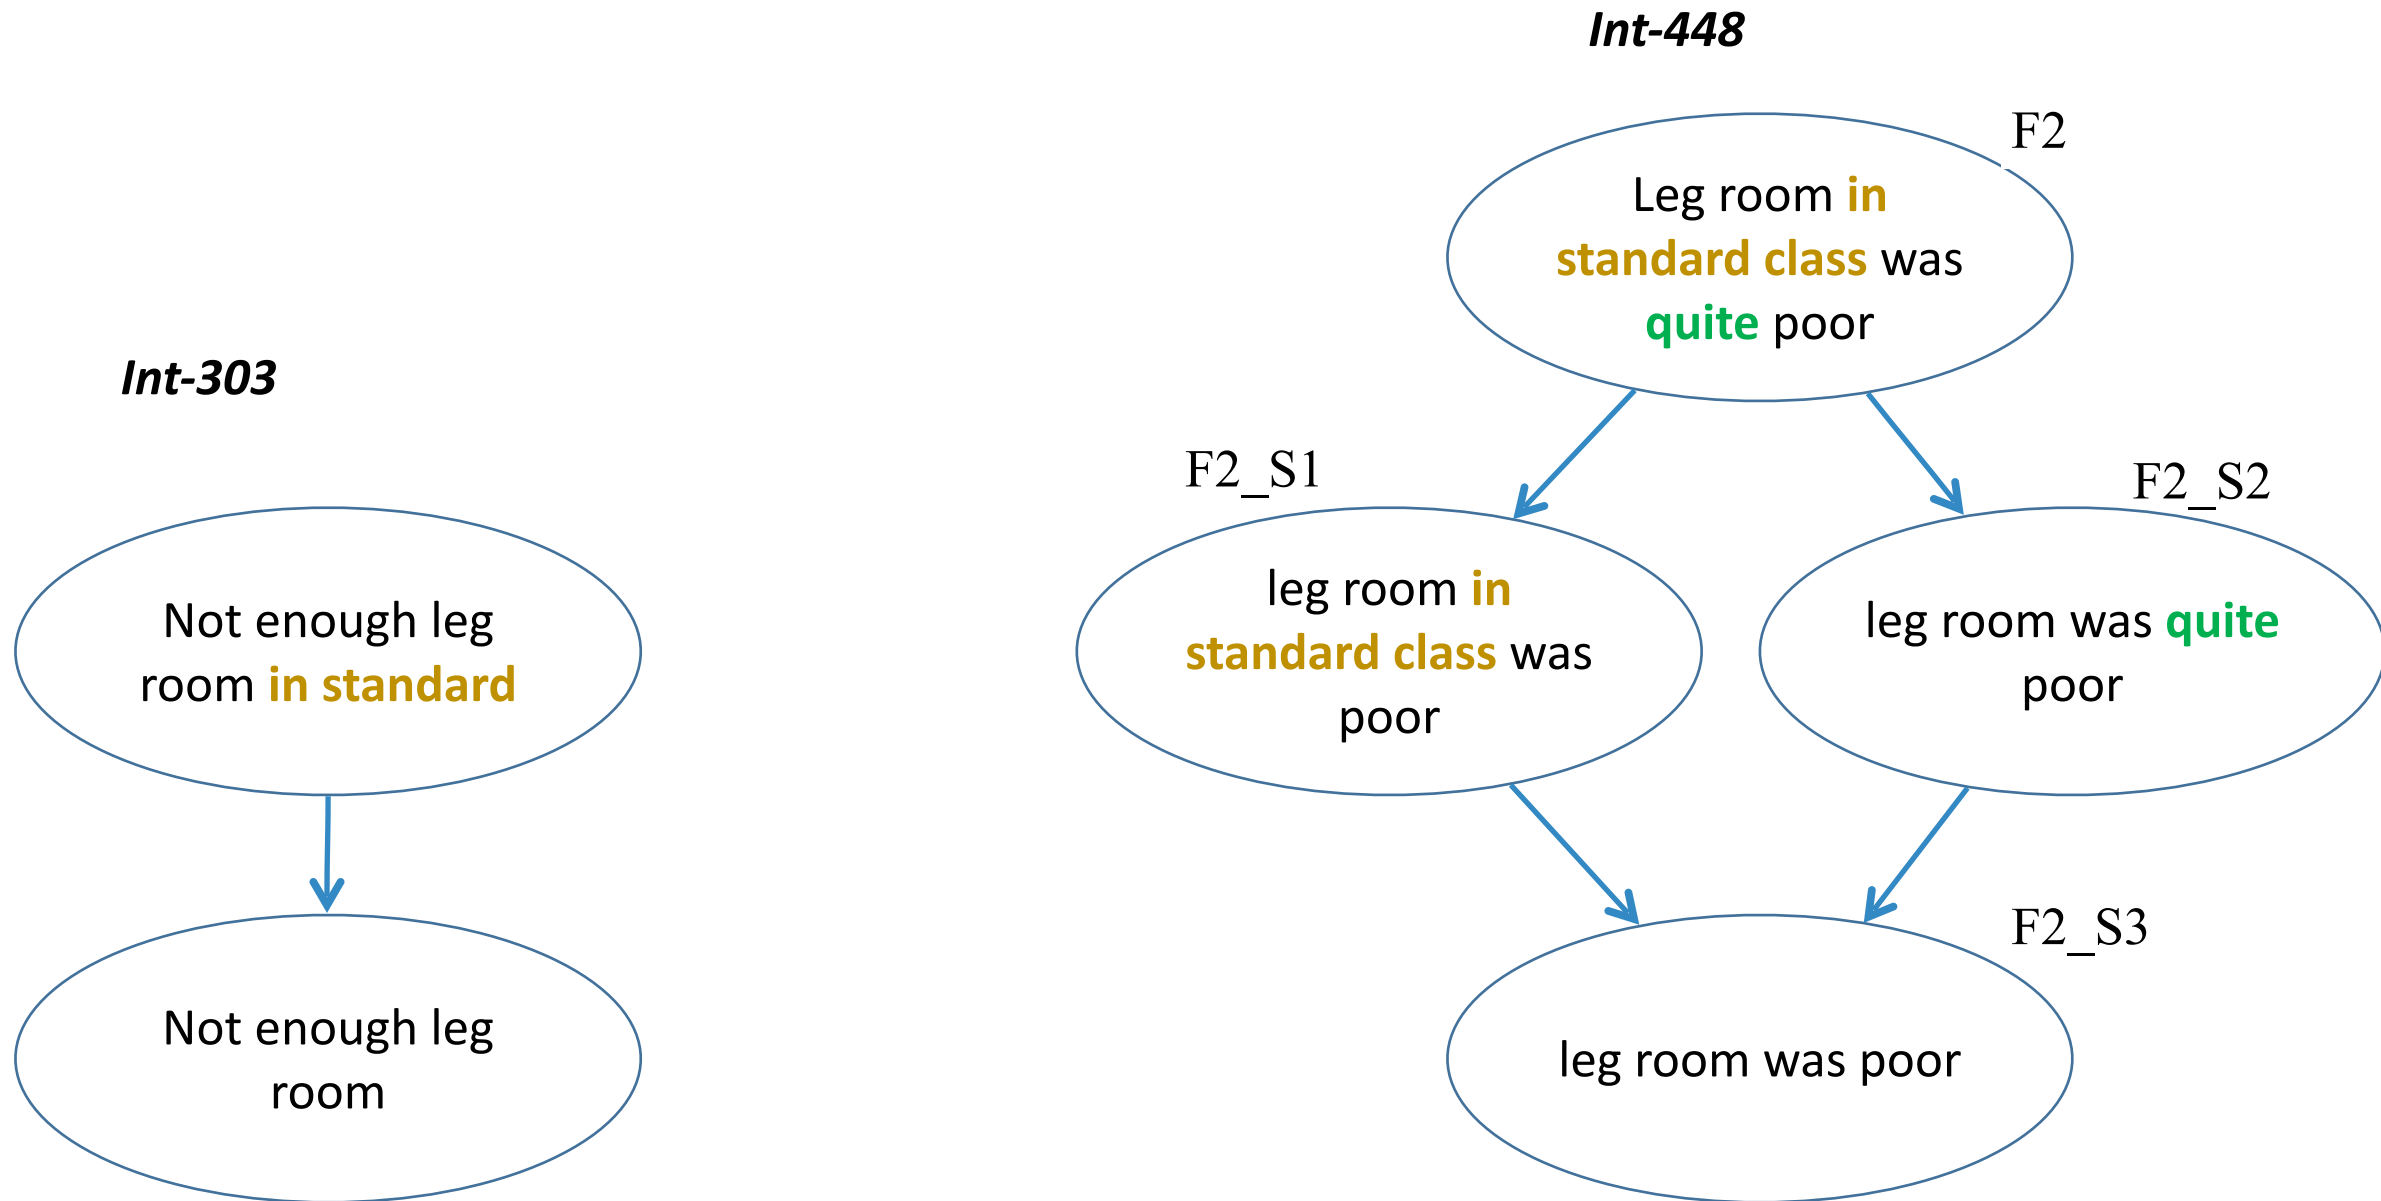

# Building Fragment Graphs

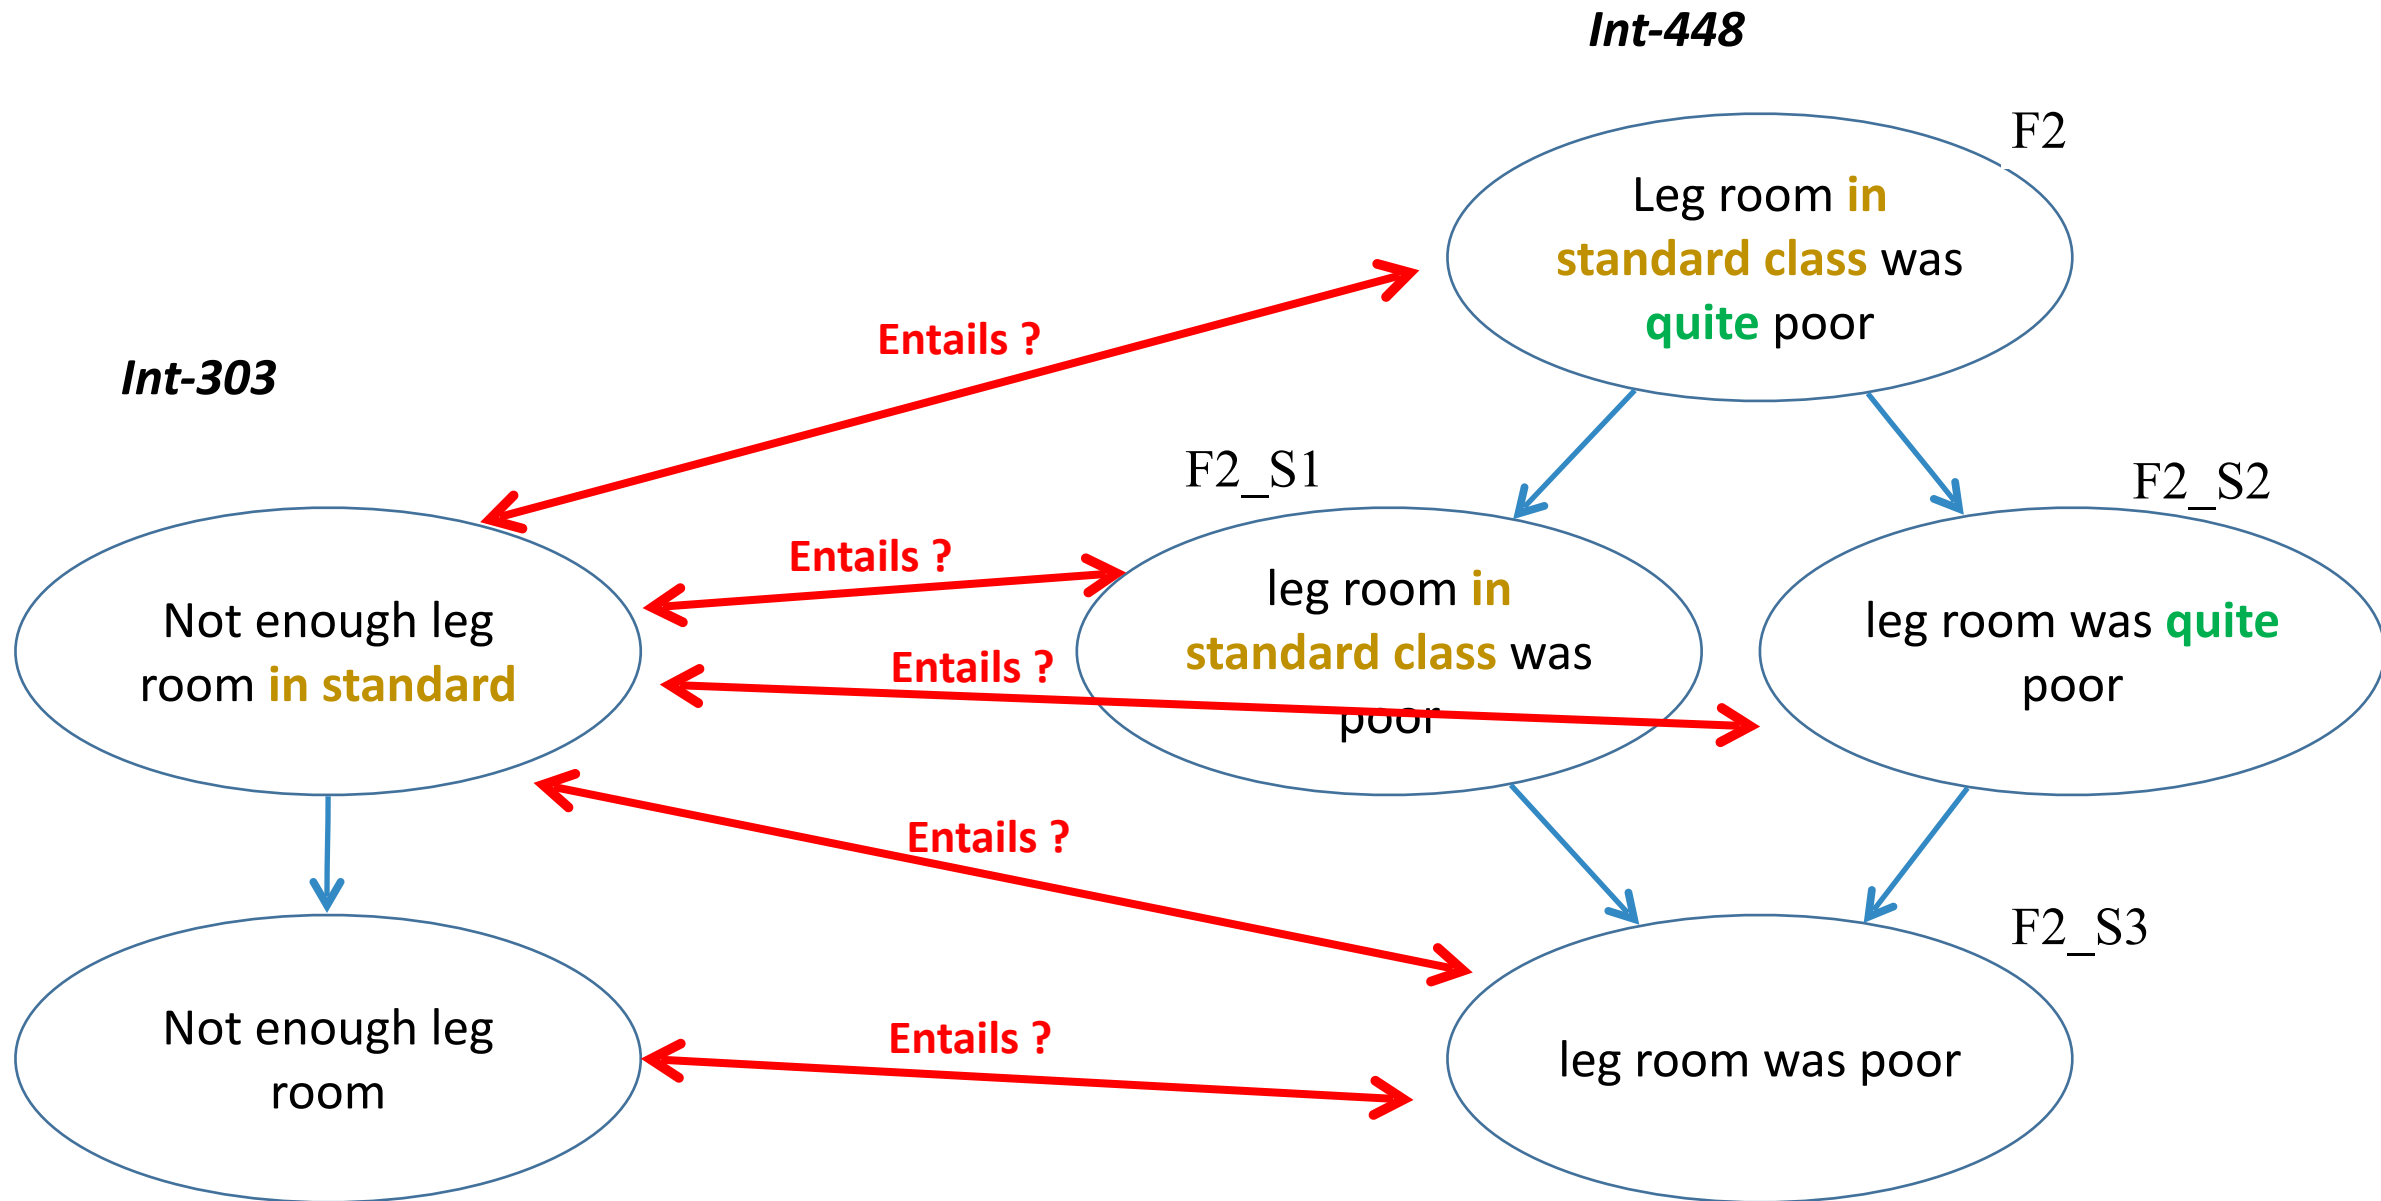

Result: a DAG

- rooted in Fragment
- Base predicate (fragment without all modifiers as only leaf)

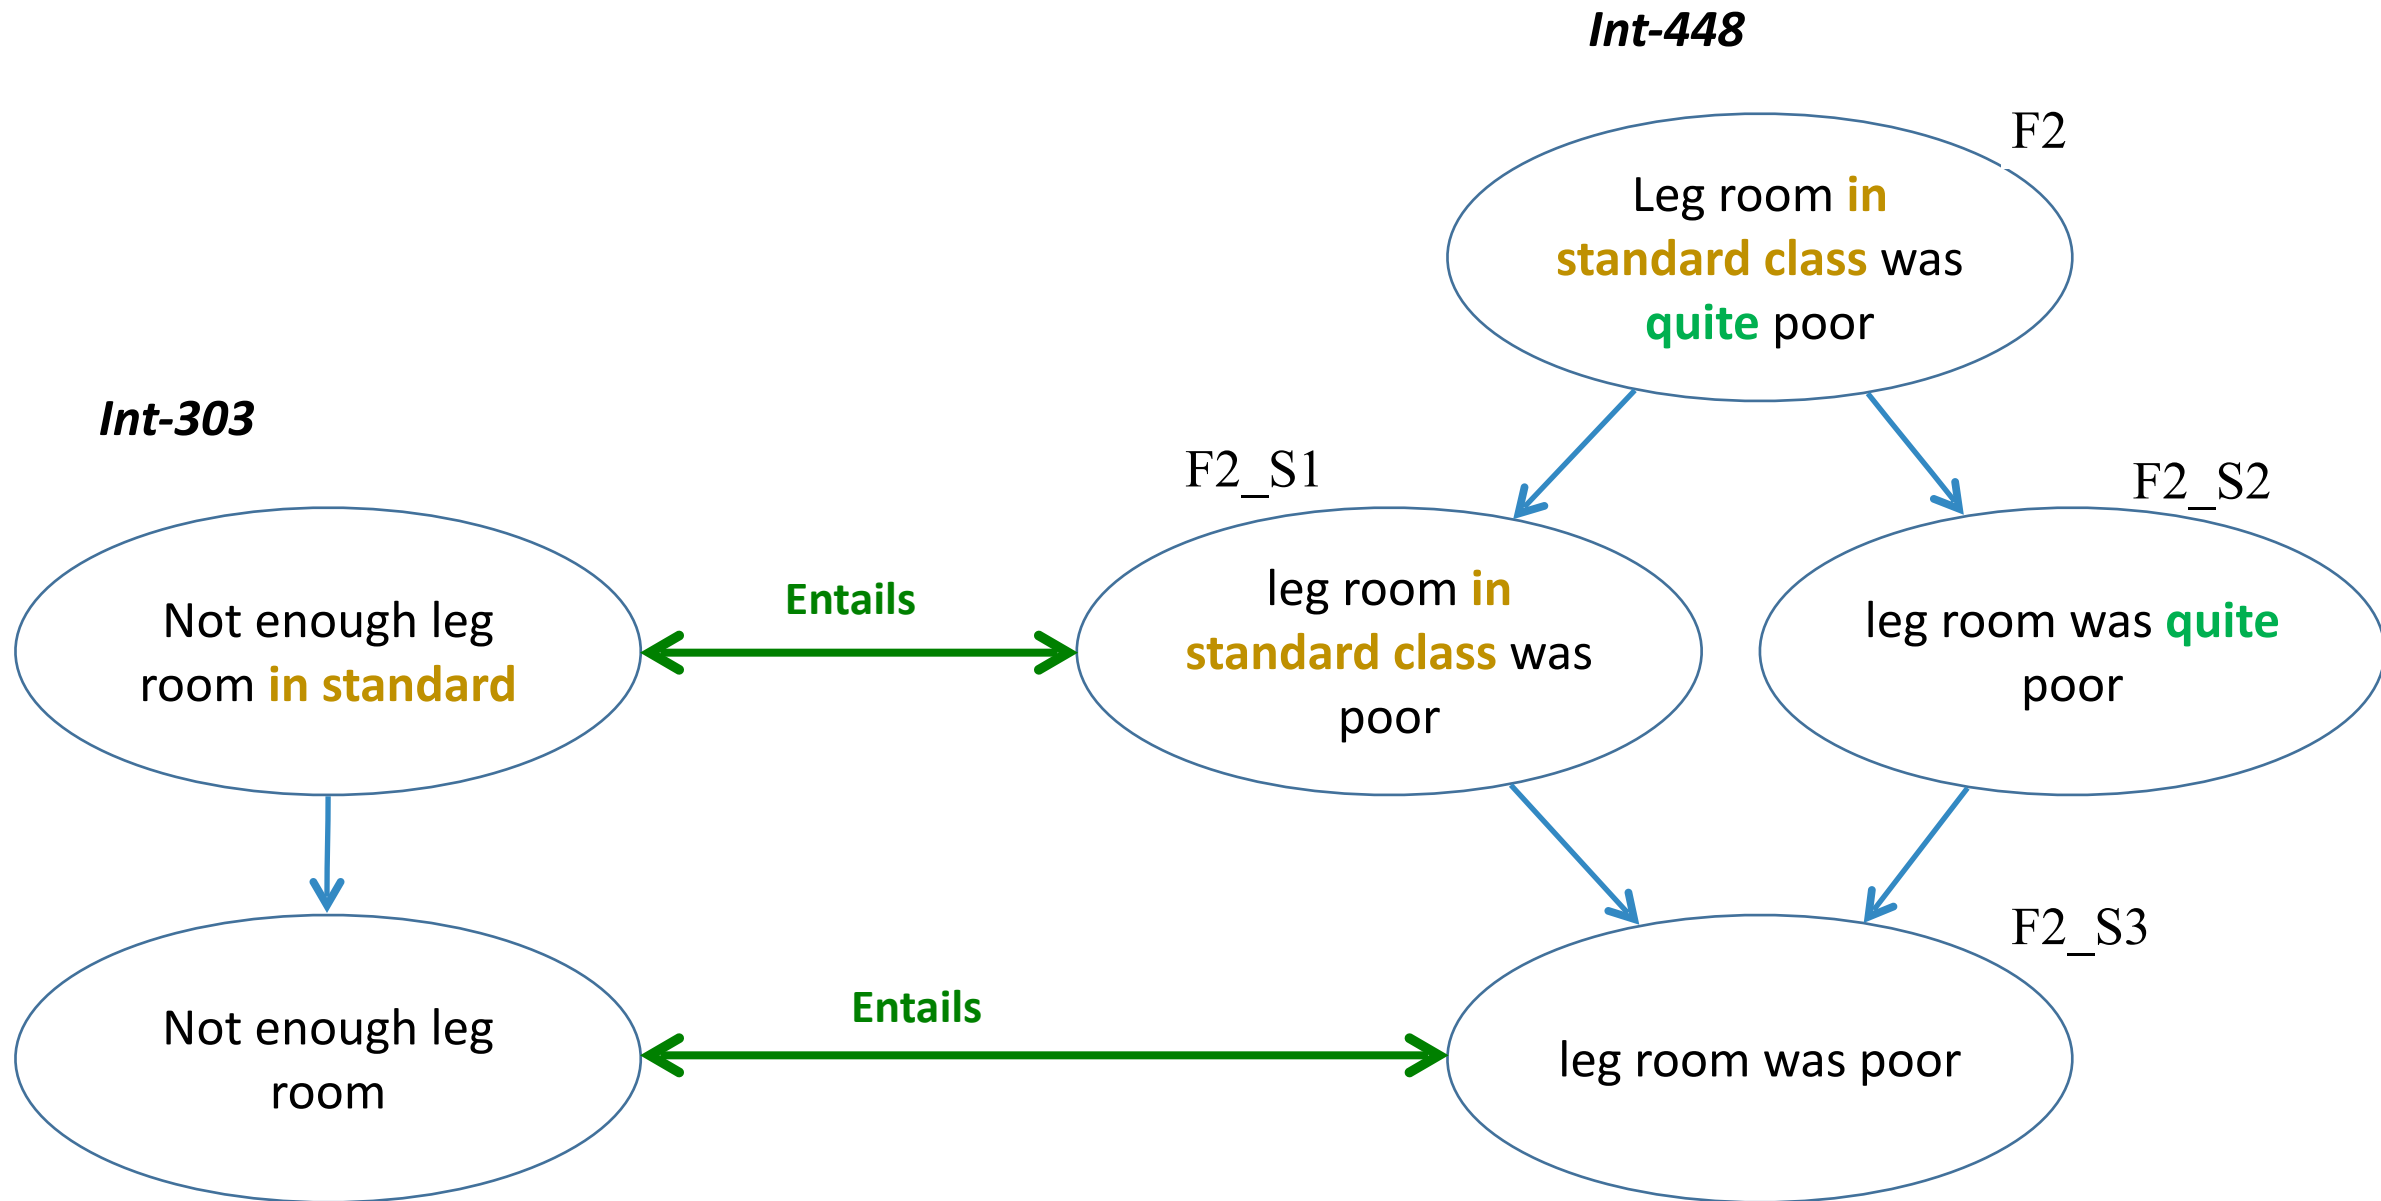

# Merging Graphs with the EOP

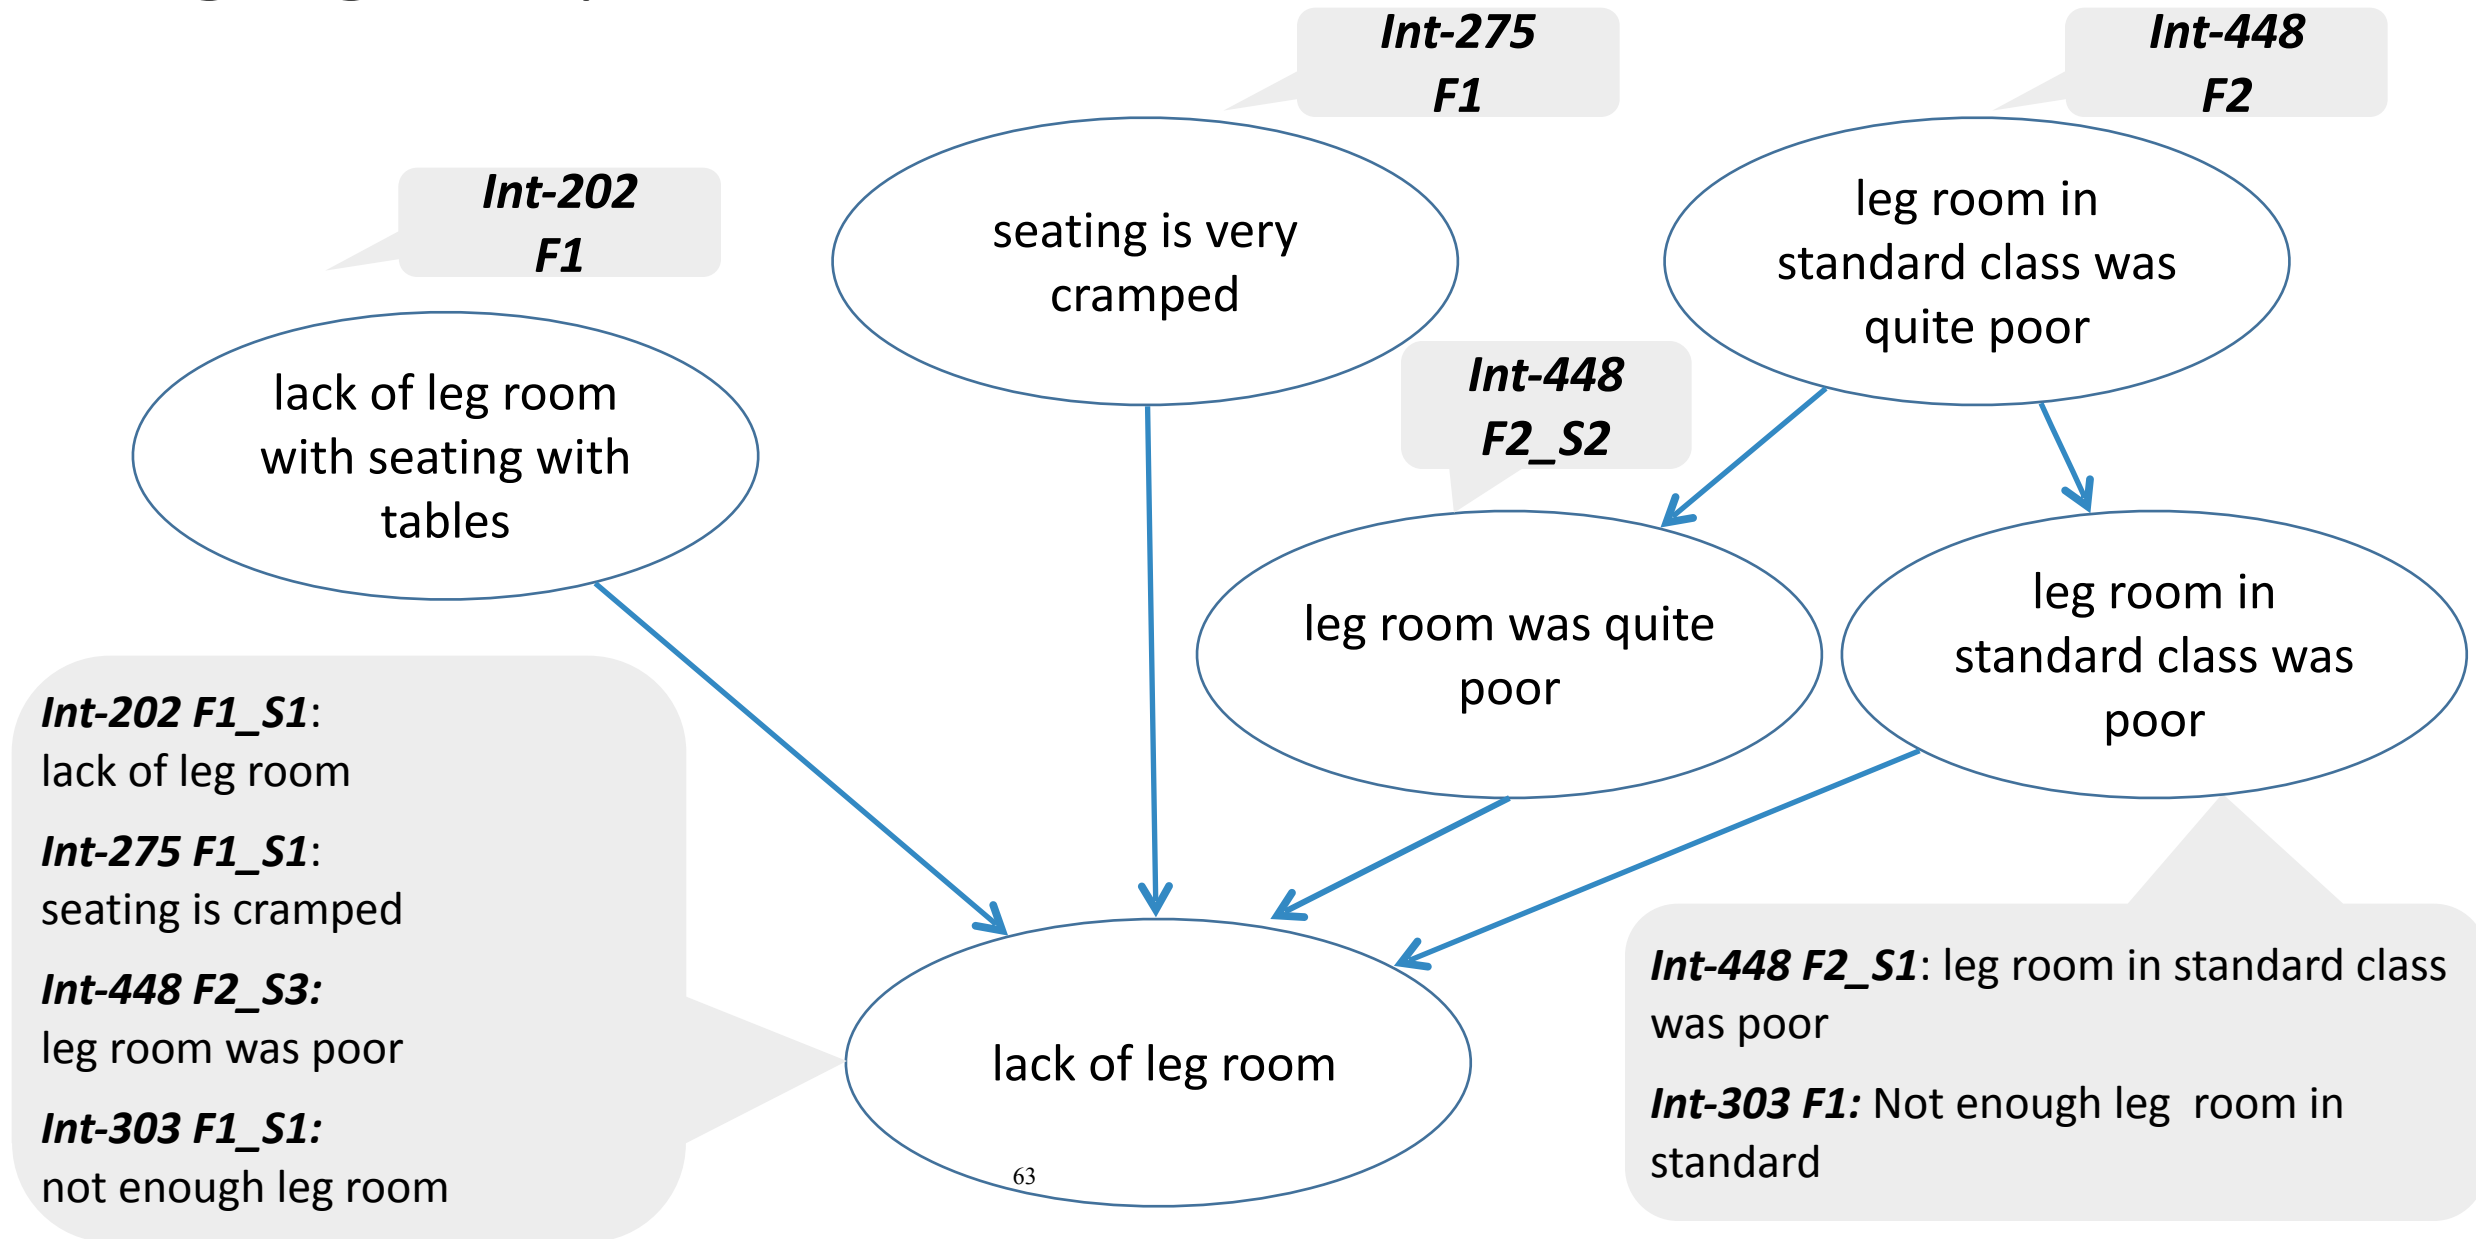

# Merging Graphs with the EOP

# Merging Graphs with the EOP

# Merging Graphs with the EOP

# Conclusion

- **Textual Entailment** provides a generic perspective for inference over textual expressions
- **Textual inference technology** is still in early stages, with limited yet potentially useful performance
- The **EXCITEMENT Open Platform** offers available technology for research
- **Entailment Graphs** have a potential for text exploration applications
- **Datasets and baseline results** for customer interactions are available for further research
