# Complexity

Only really care about large values  
amount of  $\left\{ \begin{array}{l} \text{time} \\ \text{space} \\ \dots \end{array} \right\}$  does it take for each

of the  $n$   $\left\{ \begin{array}{l} \text{characters} \\ \text{words} \\ \text{nodes} \\ \dots \end{array} \right\}$  to compute  $f(n)$

$\left\{ \begin{array}{l} \text{in the best case} \\ \text{in the worst case} \\ \text{on the average} \end{array} \right\}$  as a function of  $n$ ?

# Complexity

What is the  $\left\{ \begin{array}{l} \text{least} \\ \text{most} \end{array} \right\}$  amount of  $\left\{ \begin{array}{l} \text{time} \\ \text{space} \\ \dots \end{array} \right\}$  does it take for each

of the  $n$   $\left\{ \begin{array}{l} \text{characters} \\ \text{words} \\ \text{nodes} \\ \dots \end{array} \right\}$

Can we afford it?  
Is there a cheaper way?  
Settle for an upper  
(lower) bound

$\left\{ \begin{array}{l} \text{in the best case} \\ \text{in the worst case} \\ \text{on the average} \end{array} \right\}$  as a function of  $n$ ?

# Complexity

What is the  $\left\{ \begin{array}{l} \text{least} \\ \text{most} \end{array} \right\}$  amount of  $\left\{ \begin{array}{l} \text{time} \\ \text{space} \\ \dots \end{array} \right\}$  does it take for each

of the  $n$   $\left\{ \begin{array}{l} \text{characters} \\ \text{words} \\ \text{nodes} \\ \dots \end{array} \right\}$  to compute  $f(n)$

How much better could  
we do, anyway?

$\left\{ \begin{array}{l} \text{in the best case} \\ \text{in the worst case} \\ \text{on the average} \end{array} \right\}$  as a function of  $n$ ?

# Complexity

What is the  $\left\{ \begin{array}{l} \text{least} \\ \text{most} \end{array} \right\}$  amount of  $\left\{ \begin{array}{l} \text{time} \\ \text{space} \\ \dots \end{array} \right\}$  does it take for each

of the  $n$   $\left\{ \begin{array}{l} \text{characters} \\ \text{words} \\ \text{nodes} \\ \dots \end{array} \right\}$  to compute  $f(n)$

**There may be a trade off**

$\left\{ \begin{array}{l} \text{in the best case} \\ \text{in the worst case} \\ \text{on the average} \end{array} \right\}$  as a function of  $n$ ?

# Complexity

What is the  $\left\{ \begin{array}{l} \text{least} \\ \text{most} \end{array} \right\}$  amount of  $\left\{ \begin{array}{l} \text{time} \\ \text{space} \\ \dots \end{array} \right\}$  does it take for each

of the  $n$   $\left\{ \begin{array}{l} \text{characters} \\ \text{words} \\ \text{nodes} \\ \dots \end{array} \right\}$  to compute  $f(n)$

**Not very interesting**

$\left\{ \begin{array}{l} \text{in the best case} \\ \text{in the worst case} \\ \text{on the average} \end{array} \right\}$  as a function of  $n$ ?

# Complexity

What is the  $\left\{ \begin{array}{l} \text{least} \\ \text{most} \end{array} \right\}$  amount of  $\left\{ \begin{array}{l} \text{time} \\ \text{space} \\ \dots \end{array} \right\}$  does it take for each

of the  $n$   $\left\{ \begin{array}{l} \text{characters} \\ \text{words} \\ \text{nodes} \\ \dots \end{array} \right\}$  to compute  $f(n)$

**Generally hard**

$\left\{ \begin{array}{l} \text{in the best case} \\ \text{in the worst case} \\ \text{on the average} \end{array} \right\}$  as a function of  $n$ ?

# Complexity

What is the  $\left\{ \begin{array}{l} \text{least} \\ \text{most} \end{array} \right\}$  amount of  $\left\{ \begin{array}{l} \text{time} \\ \text{space} \\ \dots \end{array} \right\}$  does it take for each

of the  $n$   $\left\{ \begin{array}{l} \text{characters} \\ \text{words} \\ \text{nodes} \\ \dots \end{array} \right\}$  to compute  $f(n)$

**The main concern**

$\left\{ \begin{array}{l} \text{in the best case} \\ \text{in the worst case} \\ \text{on the average} \end{array} \right\}$  as a function of  $n$ ?

## Complexity

How fast does your algorithm run?

It depends on

- the programming language you write it in
- the computer you run it on
- how cleverly you code it up

Cannot give time or space. Instead, give complexity class.

## Complexity

Program 1

>

Program 2

Program 1 will always do better than Program 2 for problems of size  $n$  if  $n$  is large enough

## Asymptotic Complexity

In general, just the order of the asymptotic complexity is of interest, i.e. if it is a linear, a quadratic or an exponential function.

The order is denoted by a complexity class using the **O-notation**.

## Complexity Classes: Big O

$O(1)$	constant
$O(\log n)$	logarithmic
$\log(\log(n))$	log log
$O(n)$	linear
$O(n^k)$	polynomial—quadratic
$O(m^n)$	exponential (intractable)

$$g(n) \in O(f(n))$$

$$g(n) = O(f(n))$$

## The Cocke-Kasami-Younger Algorithm (1960)

Grammar  
 $S \rightarrow NP VP$   
 $VP \rightarrow V NP$   
 $NP \rightarrow Det N$

Grammar  
 $S \rightarrow NP VP$   
 $VP \rightarrow V NP$   
 $NP \rightarrow Det N$

Grammar  
 $S \rightarrow NP VP$   
 $VP \rightarrow V NP$   
 $NP \rightarrow Det N$

$\frac{n(n+1)}{2} = O(n^2)$  cells to fill  $n$  ways of filling them

$\Rightarrow O(n^3)$

## The CKY Algorithm

```

for len in (2..words.length)
  for pos in (0..words.length-len+1)
    for first_len in (1..len)
      for first_cat in chart[pos][first_len-1]
        for second_cat in chart[pos+first_len][len-first_len-1]
          if c = @grammar[[first_cat.cat, second_cat.cat]]
            add_edge(chart[pos][len-1], c, first_len, left, right)
          end
        end
      end
    end
  end
end
end
end
end
end

```

$n^3$

$C^2$

## Big O

$f(x) \in O(g(x))$  as  $x \rightarrow \infty$

iff

$|f(x)| \leq M|g(x)|$  for all  $x > x_0$

i.e. for sufficiently large values of  $x$  has an upper bound which is a constant times  $g(x)$ .

Generally, we take the "as  $x \rightarrow \infty$ " part for

granted, and write simply

$f(x) \in O(g(x))$  or  $f(x) = O(g(x))$

## Big O

- If  $x$  is a sum of several terms, we keep the one with the largest growth rate, and all others are omitted.
- If  $x$  is a product of several factors, any constants (terms in the product that do not depend on  $x$ ) are omitted.

## Complexity

- As  $n$  grows large, the  $n^2$  will come to dominate, so that other terms can be neglected. For example, when  $n=500$ ,  $4n^2$  is 1000 times as large as  $2^n$ .
- Coefficients become irrelevant when compared with, for example, an expression containing  $n^3$  or  $n^2$ .
- Numbers of steps depends on the machine model, but differences among machines rarely contribute more than a constant factor.
