Language Technology II
SS 2012

- Investigate two on-line MT engines by sending sentences through both of them and comparing the results
 - Use <http://translate.google.com/> as a typical SMT system and compare with <http://babelfish.yahoo.com/> (based on Systran)
- Try to find typical errors of both systems. Try variations of input sentences to find out whether the systems „understand“ what they translate
- Send us the most interesting/funny errors you encounter, so that we all can learn & have fun
- Due: May 30th
