

Semantic Theory

Week 1: Predicate Logic

Logic & Semantic Theory

Let's meet the players

Part I: Sentence semantics

The most certain principle in semantics

Max Cresswell (1975): “For two sentences A and B , if in some possible situation A is true and B is false, A and B must have different meanings.”

- Knowing the meaning of a (declarative) sentence requires knowing what the world would have to be like for the sentence to be true:

Meaning = Truth Conditions

- Applied to logical representations:

*For sentence A and formula α : If there is a possible situation in which A is true and α is not, or vice versa, then α is **not** an appropriate meaning representation for A .*

A central notion: Entailment

- Tina is tall and thin \Rightarrow Tina is tall
- Tina is tall, and Ms. Turner is not tall \Rightarrow Tina is not Ms. Turner
- A dog entered the room \Rightarrow An animal entered the room
- Tweety is a bird \nRightarrow Tweety can fly

Definition

“Given an **indefeasible** relation between two natural language sentences S_1 and S_2 , where speakers intuitively judge S_2 to be true whenever S_1 is true, we say that S_1 **entails** S_2 , and denote it $S_1 \Rightarrow S_2$ ”

Truth-conditional formal semantics

- The meaning representation of a sentence must be true in exactly the same situations as the sentence itself.

“Harry is a prince”

language

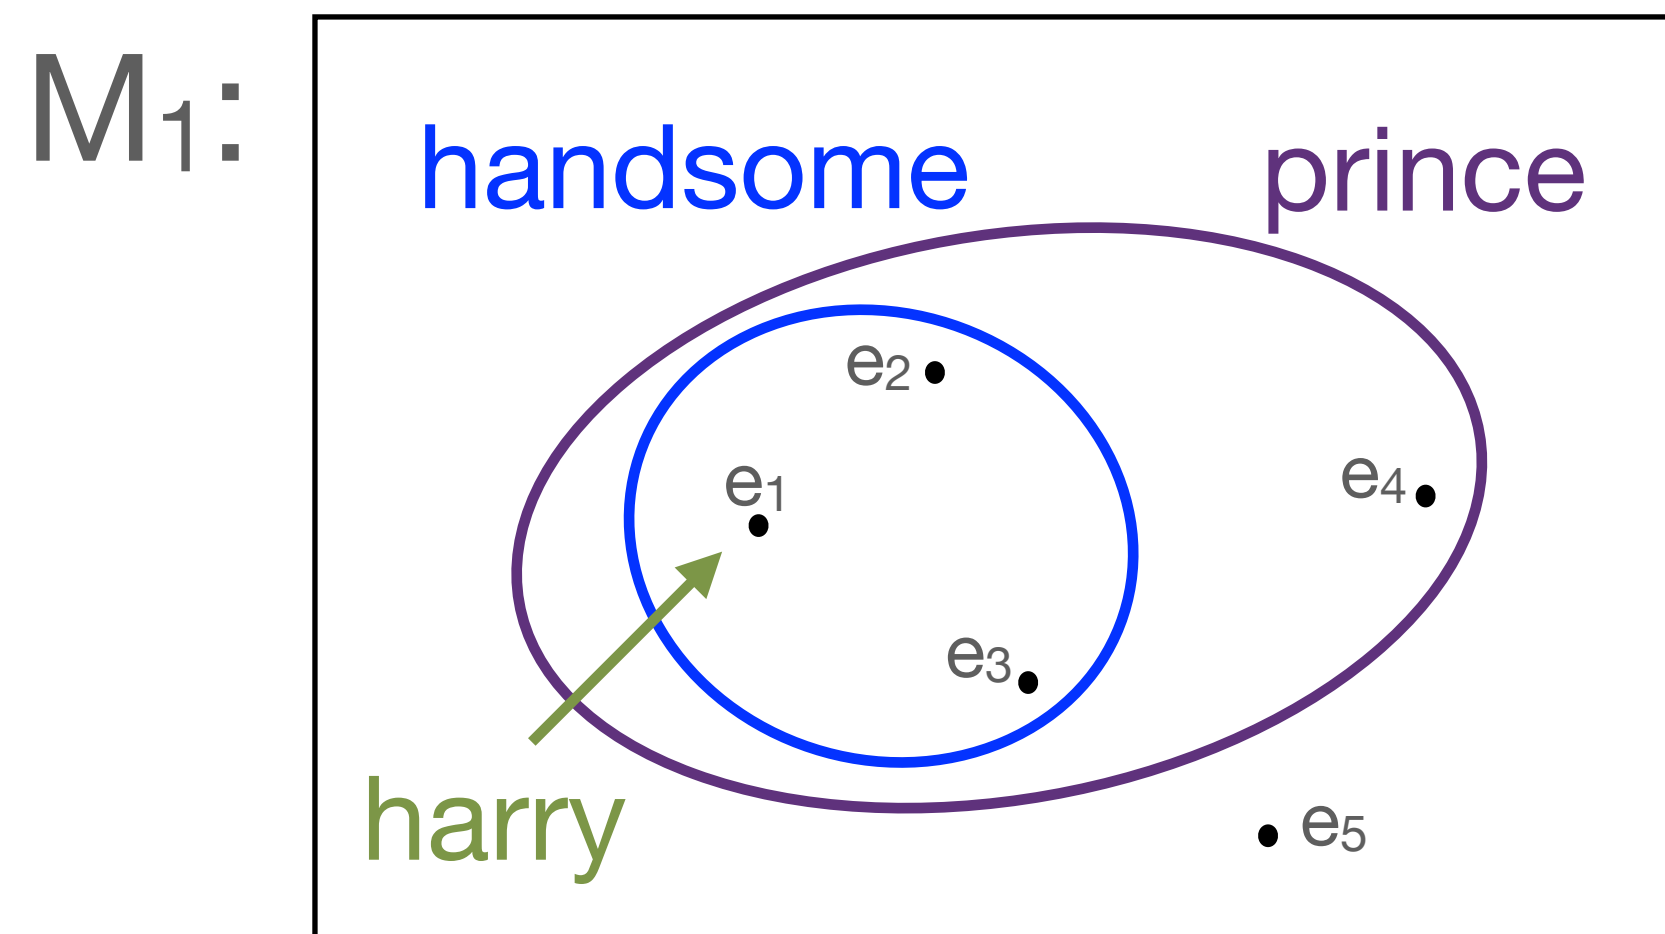

prince(harry)

logic

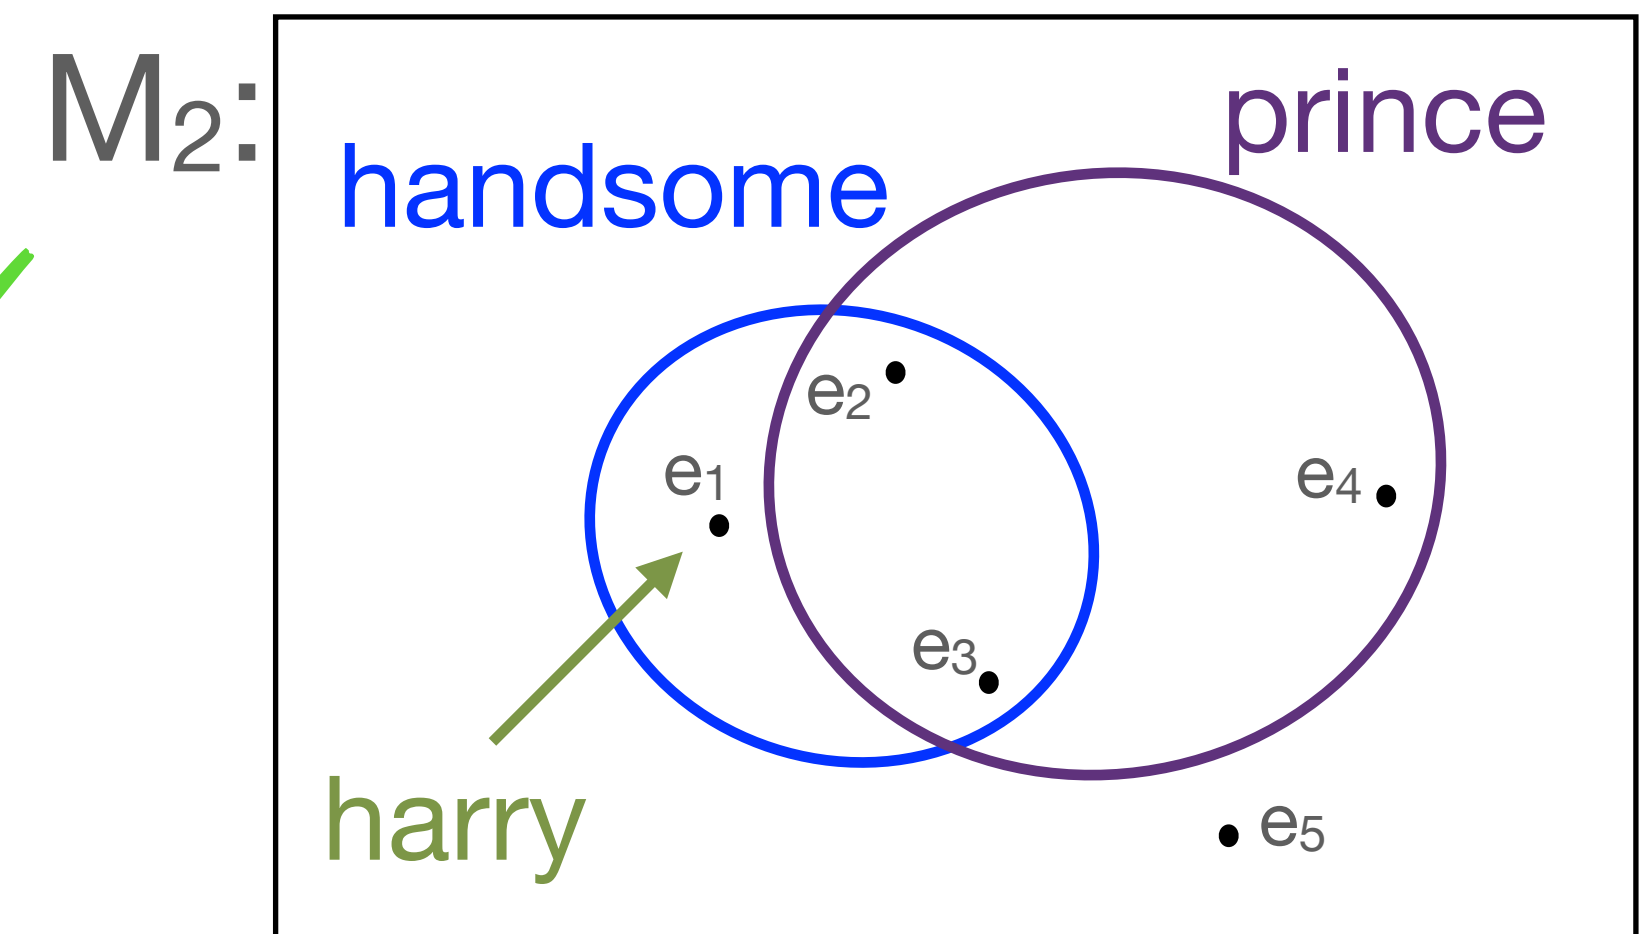

Model structures and formulas

- A **model structure** is a formal representation of a single possible situation
- A **formula** is a statement about model structures in a formal language
- Formulae obtain a **truth value** (true / false) with respect to model structure M.

✓ handsome(harry) ✓

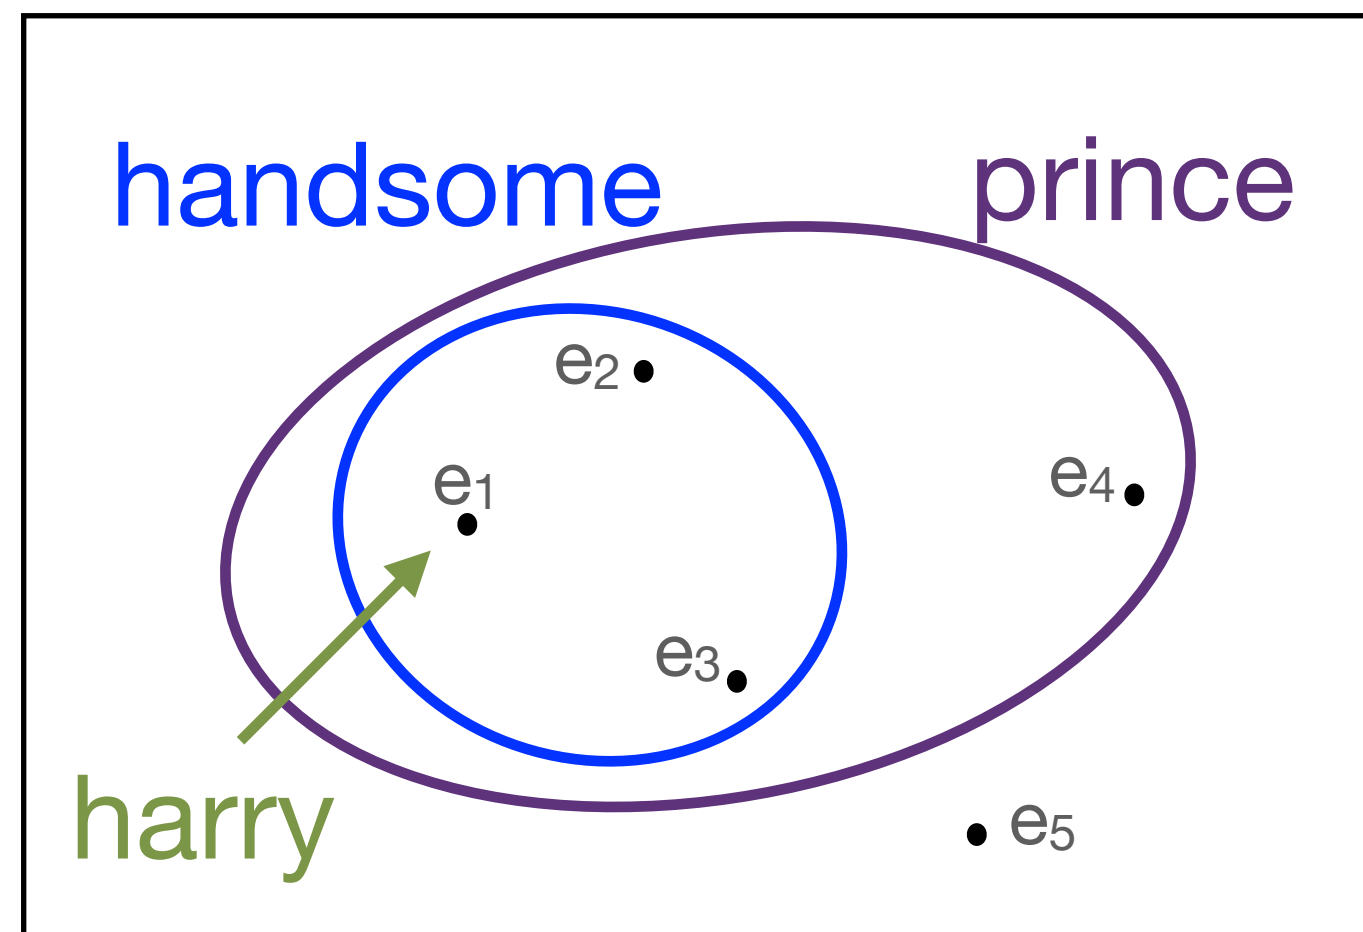

✓ prince(harry) ✗

Model structures: Definition

- Formally, a **model structure** M can be defined as a tuple $M = \langle U, V \rangle$, where:
 - U is a set of individual entities, called the *universe* (sometimes called *domain* D);
 - V is an *interpretation function* (sometimes denoted by I) that maps formula expressions onto (sets of) these entities.

M_1 :

$M_1 = \langle U_1, V_1 \rangle$, where:

- $U_1 = \{e_1, e_2, e_3, e_4, e_5\}$
- $V_1(\text{handsome}) = \{e_1, e_2, e_3\}$
 $V_1(\text{prince}) = \{e_1, e_2, e_3, e_4\}$
 $V_1(\text{harry}) = e_1$

Formulas: Logical languages

- A logical language is a mathematical device that defines under what conditions a **model** makes a **formula** true.
- **Propositional logic:** Propositions as basic atoms
 - Syntax: propositions (p, q, \dots), logical connectives ($\neg, \wedge, \vee, \rightarrow, \leftrightarrow$)
 - Semantics: truth tables — truth conditions, entailment
 - Limitation: propositions with internal structure
- **First-order predicate logic (FOL):** Predicates and arguments
 - Syntax: predicates, constants and variables ($love(j, m), mortal(x), \dots$), quantifiers (\forall, \exists), logical connectives ($\wedge, \vee, \neg, \rightarrow, \leftrightarrow$)
 - Semantics: model structures and variable assignments

p	q	$p \& q$	$p \vee q$	$p \rightarrow q$	$p \leftrightarrow q$
T	T	T	T	T	T
T	F	F	T	F	F
F	T	F	T	T	F
F	F	F	F	T	T

Gottlob Frege
Begriffsschrift (1879)

First-order predicate logic: Vocabulary

- **Non-logical expressions:**

Individual constants: CON

n-place relation constants: $PRED^n$, for all $n \geq 0$

- **Infinite set of individual variables:** VAR

- **Logical connectives:** $\wedge, \vee, \neg, \rightarrow, \leftrightarrow, \forall, \exists$

- **Brackets:** (,)

First-order predicate logic: Syntax

Logic in action
Ch4: pg 26

Terms: $TERM = VAR \cup CON$

Atomic formulas:

- $R(t_1, \dots, t_n)$ for $R \in PRED^n$ and $t_1, \dots, t_n \in TERM$
- $t_1 = t_2$ for $t_1, t_2 \in TERM$

Well-formed formula (WFF):

1. All atomic formulas are WFFs;
2. If ϕ and ψ are WFFs, then $\neg\phi$, $(\phi \wedge \psi)$, $(\phi \vee \psi)$, $(\phi \rightarrow \psi)$, $(\phi \leftrightarrow \psi)$ are WFFs;
3. If $x \in VAR$, and ϕ is a WFF, then $\forall x\phi$ and $\exists x\phi$ are WFFs;
4. Nothing else is a WFF.

FOL Formulas

Which formulas are **not** well-formed?

- | | |
|--|---|
| X 1. prince | <i>assuming: prince \in PRED¹</i> |
| ✓ 2. prince(x) | <i>free variable: x</i> |
| X 3. prince(harry \wedge william) | <i>correct: prince(harry) \wedge prince(william)</i> |
| ✓ 4. \neg prince(harry) | <i>only if interpreted as: \neg(prince(harry))</i> |
| ✓ 5. rain \rightarrow happy(kate) | <i>only if: rain \in PRED⁰ (\sim “it rains”)</i> |
| ✓ 6. $\forall x$ (rain) | <i>vacuous quantifier: $\forall x$</i> |
| ✓ 7. $\exists x(\forall x(\text{happy}(x)))$ | <i>vacuous quantifier: $\exists x$</i> |
| ✓ 8. $\forall x(\text{prince}(x)) \rightarrow \text{handsome}(x)$ | <i>watch the brackets! free variable: last x</i> |

Variable binding

- Given a quantified formula $\forall x\phi$ (or $\exists x\phi$), we say that ϕ , and every part of ϕ , is in the **scope** of the quantifier;
- In a formula $\forall x\phi$ (or $\exists x\phi$), the quantifier occurrence **binds** all occurrences of x in ϕ that are not bound by any quantifier occurrence $\forall x$ or $\exists x$ *inside* ϕ ;
- If a variable is not bound in formula ϕ , it occurs **free** in ϕ ;
- A **closed formula** is a formula without free variables (in natural language semantics, we generally only use closed formulae);
- A quantifier $\forall x$ or $\exists x$ is called **vacuous** if it has no free occurrences of x in its scope.

First-order predicate logic: Semantics

Logic in action
Ch4: pp. 30-31

Interpretation of constants, predicates and variables

- FOL formulas obtain a truth value with respect to a *model structure* M and an *assignment function* g : $\llbracket \phi \rrbracket^{M,g} := [0/1]$
- First-ordered model structures are formally defined as tuples $M = \langle U_M, V_M \rangle$, where U_M is a non-empty set (the *universe*) and V_M is an interpretation function:
 - $\llbracket c \rrbracket^{M,g} = V_M(c) \in U_M$ if c is an individual constant
 - $\llbracket P \rrbracket^{M,g} = V_M(P) \subseteq U_M^n$ if P is an n -place predicate symbol
 - $\llbracket P \rrbracket^{M,g} = V_M(P) \in \{0,1\}$ if P is a 0-place predicate
- The assignment function g maps variables onto elements of the universe:
 $g :: VAR \rightarrow U_M$
 - $\llbracket x \rrbracket^{M,g} = g(x) \in U_M$ if x is a variable

Assignment function

Mapping variables onto model entities

An assignment function g assigns values to all variables

- $g :: \text{VAR} \rightarrow U_M$
- We write $g[x/d]$ for the assignment function g' that assigns d to x and assigns the same values as g to all other variables.

	x	y	z	u	...
g	e_1	e_2	e_3	e_4	\dots
$g[y/e_1]$	e_1	e_1	e_3	e_4	\dots
$g[x/e_1]$	e_1	e_2	e_3	e_4	\dots
$g[y/g(z)]$	e_1	e_3	e_3	e_4	\dots
$g[y/e_1][u/e_1]$	e_1	e_1	e_3	e_1	\dots
$g[y/e_1][y/e_2]$	e_1	e_2	e_3	e_4	\dots

Assignment function

Interpretation of variables and quantifiers

How to interpret the following sentence in model M:

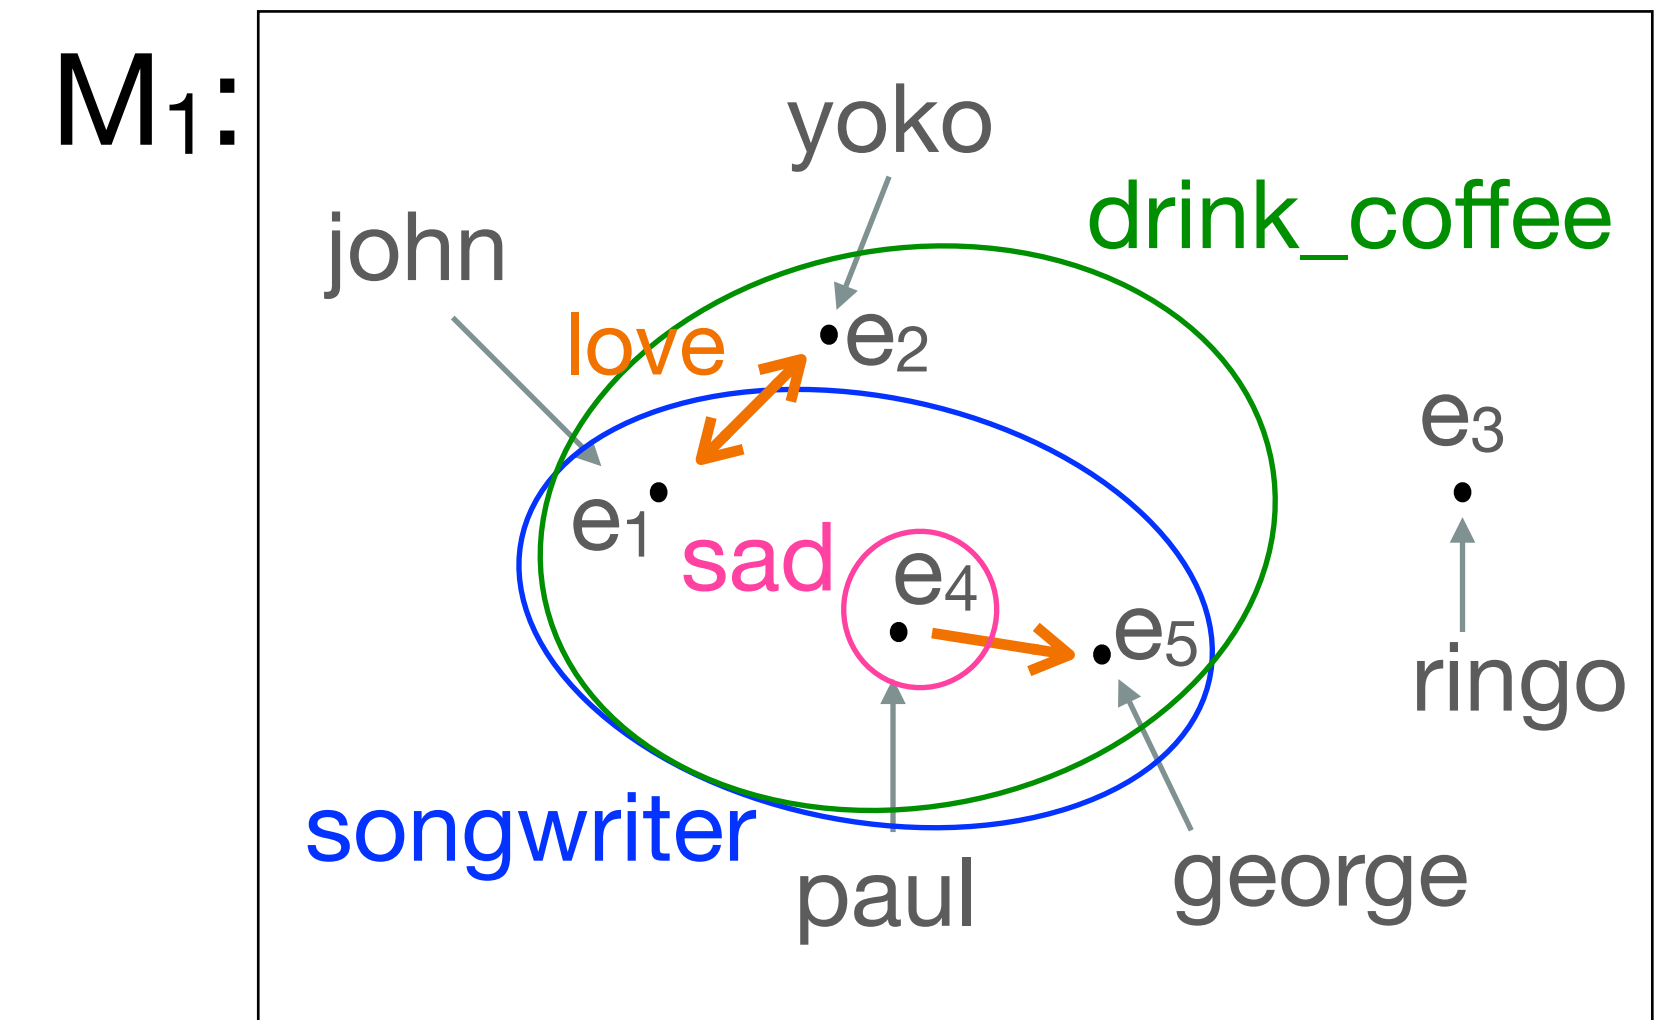

- Someone is sad $\mapsto \exists x(\text{sad}'(x))$

Intuition:

- find an entity in the universe for which the statement $x \in V_M(\text{sad}')$ holds: e_4
- replace x by e_4 in order to make $\exists x(\text{sad}'(x))$ true:

More formally:

- Interpret sentence relative to *assignment function* g : i.e., $\llbracket \exists x(\text{sad}'(x)) \rrbracket^{M,g}$, such that $g(x) = e_4$; this can be generalised to any g' as follows: $g'[x/e_4](x) = e_4$

$M_1 = \langle U_1, V_1 \rangle$, where:

- $U_1 = \{e_1, e_2, e_3, e_4, e_5\}$
- $V_1(\text{john}) = e_1$; $V_1(\text{yoko}) = e_2$;
 $V_1(\text{ringo}) = e_3$; $V_1(\text{paul}) = e_4$;
 $V_1(\text{george}) = e_5$
- $V_1(\text{song-writer}) = \{e_1, e_4, e_5\}$
 $V_1(\text{drink_coffee}) = \{e_1, e_2, e_4, e_5\}$
 $V_1(\text{love}) = \{\langle e_1, e_2 \rangle, \langle e_2, e_1 \rangle, \langle e_4, e_5 \rangle\}$
 $V_1(\text{sad}) = \{e_4\}$

First-order predicate logic: Semantics

Interpretation of formulas

Well-formed formulas are interpreted with respect to a model structure M and an assignment function g :

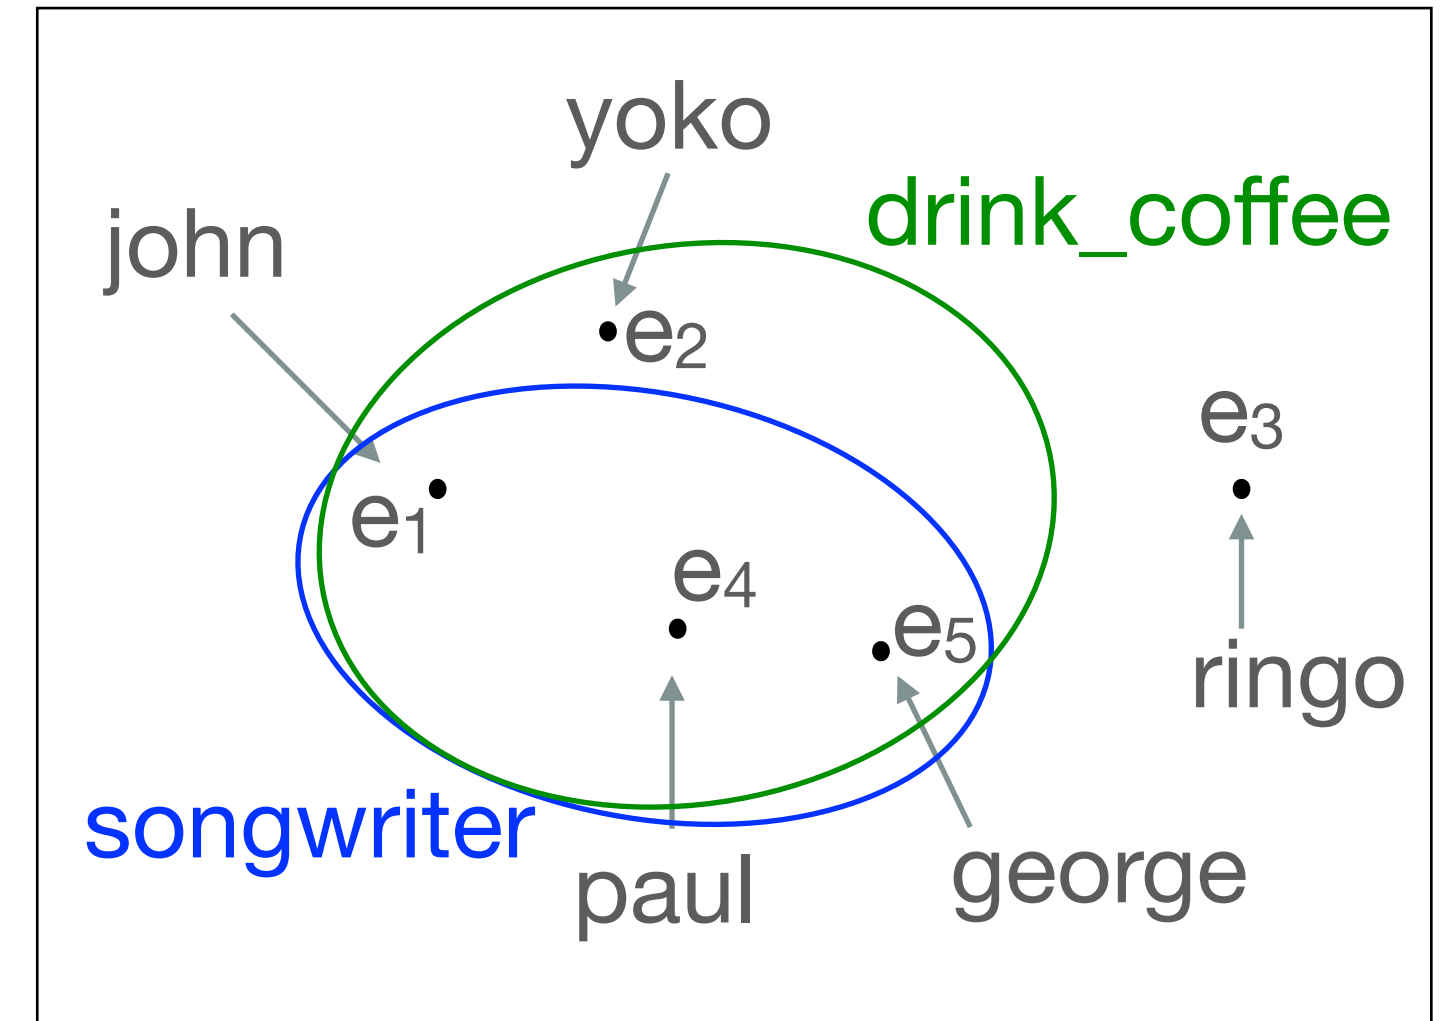

- $\llbracket R(t_1, \dots, t_n) \rrbracket^{M,g} = 1$ iff $\langle \llbracket t_1 \rrbracket^{M,g}, \dots, \llbracket t_n \rrbracket^{M,g} \rangle \in V_M(R)$
- $\llbracket t_1 = t_2 \rrbracket^{M,g} = 1$ iff $\llbracket t_1 \rrbracket^{M,g} = \llbracket t_2 \rrbracket^{M,g}$
- $\llbracket \neg \phi \rrbracket^{M,g} = 1$ iff $\llbracket \phi \rrbracket^{M,g} = 0$
- $\llbracket \phi \wedge \psi \rrbracket^{M,g} = 1$ iff $\llbracket \phi \rrbracket^{M,g} = 1$ and $\llbracket \psi \rrbracket^{M,g} = 1$
- $\llbracket \phi \vee \psi \rrbracket^{M,g} = 1$ iff $\llbracket \phi \rrbracket^{M,g} = 1$ or $\llbracket \psi \rrbracket^{M,g} = 1$
- $\llbracket \phi \rightarrow \psi \rrbracket^{M,g} = 1$ iff $\llbracket \phi \rrbracket^{M,g} = 0$ or $\llbracket \psi \rrbracket^{M,g} = 1$
- $\llbracket \phi \leftrightarrow \psi \rrbracket^{M,g} = 1$ iff $\llbracket \phi \rrbracket^{M,g} = \llbracket \psi \rrbracket^{M,g}$
- $\llbracket \exists x \phi \rrbracket^{M,g} = 1$ iff there is a $d \in U_M$ such that $\llbracket \phi \rrbracket^{M,g[x/d]} = 1$
- $\llbracket \forall x \phi \rrbracket^{M,g} = 1$ iff for all $d \in U_M$, $\llbracket \phi \rrbracket^{M,g[x/d]} = 1$

Interpretation of formulas

Computing truth conditions and truth values

- “Every songwriter drinks coffee”: $\forall x(\text{songwriter}(x) \rightarrow \text{drink_coffee}(x))$
- **Truth conditions** w.r.t. M_1 : $\llbracket \forall x(\text{songwriter}(x) \rightarrow \text{drink_coffee}(x)) \rrbracket^{M,g} = 1$
iff for all $e \in U$: $\llbracket \text{songwriter}(x) \rightarrow \text{drink_coffee}(x) \rrbracket^{M,g[x/e]} = 1$
iff for all $e \in U$: $\llbracket \text{songwriter}(x) \rrbracket^{M,g[x/e]} = 0$ or $\llbracket \text{drink_coffee}(x) \rrbracket^{M,g[x/e]} = 1$
iff for all $e \in U$: $\llbracket x \rrbracket^{M,g[x/e]} \notin V_M(\text{songwriter})$ or $\llbracket x \rrbracket^{M,g[x/e]} \in V_M(\text{drink_coffee})$
iff for all $e \in U$: $g[x/e](x) \notin V_M(\text{songwriter})$ or $g[x/e](x) \in V_M(\text{drink_coffee})$
iff for all $e \in U$: $e \notin V_M(\text{songwriter})$ or $e \in V_M(\text{drink_coffee})$
iff $V_M(\text{songwriter}) \subseteq V_M(\text{drink_coffee})$
- **Truth value** in M_1 : let $\phi = \text{songwriter}(x) \rightarrow \text{drink_coffee}(x)$
 For $e = e_1, e_2, e_4, e_5$: $\llbracket \phi \rrbracket^{M_1,g[x/e]} = 1$ since $e \in V_M(\text{drink_coffee})$;
 For $e = e_3$: $\llbracket \phi \rrbracket^{M_1,g[x/e]} = 0$ since $e \notin V_M(\text{songwriter})$.
 Therefore: $\llbracket \forall x(\text{songwriter}(x) \rightarrow \text{drink_coffee}(x)) \rrbracket^{M_1,g} = 1$ for any g .

M_1 :

$M_1 = \langle U_1, V_1 \rangle$, where:

- $U_1 = \{e_1, e_2, e_3, e_4, e_5\}$
- $V_1(\text{john}) = e_1$; $V_1(\text{yoko}) = e_2$;
 $V_1(\text{ringo}) = e_3$; $V_1(\text{paul}) = e_4$;
 $V_1(\text{george}) = e_5$
- $V_1(\text{song-writer}) = \{e_1, e_4, e_5\}$
 $V_1(\text{drink_coffee}) = \{e_1, e_2, e_4, e_5\}$

Formalizing Natural Language

Exercise

1. *Bill loves Mary.*
2. *Bill reads an interesting book.*
3. *Every student reads a book.*
4. *Bill passed every exam.*
5. *Not every student answered every question.*
6. *Only Mary answered every question.*
7. *Mary is annoyed when someone is noisy.*
8. *Although nobody makes noise, Mary is annoyed.*

Try translating these sentences!

Truth, validity and entailment

- A formula φ is **true** in a model M iff:
 $\llbracket \varphi \rrbracket^{M,g} = 1$ for every variable assignment g
- A formula φ is **valid** ($\models \varphi$) iff:
 φ is true in all models
- A formula φ is **satisfiable** iff:
there is at least one model M such that φ is true in M
- A set of formulas Γ **entails** formula φ ($\Gamma \models \varphi$) iff:
 φ is true in every model in which all formulas in Γ are true
 - the elements of Γ are called the **premises** or **hypotheses**
 - φ is called the **conclusion**

Logical Equivalence

Formula ϕ is logically equivalent to formula ψ ($\phi \Leftrightarrow \psi$), iff:

- $\llbracket \phi \rrbracket^{M,g} = \llbracket \psi \rrbracket^{M,g}$ for all models M and variable assignments g .

For all *closed* formulas ϕ and ψ , the following assertions are equivalent:

1. $\phi \Leftrightarrow \psi$ (logical equivalence)
2. $\phi \models \psi$ and $\psi \models \phi$ (mutual entailment)
3. $\models \phi \leftrightarrow \psi$ (validity of “material equivalence”)

Logical Equivalence Theorems

Propositional logic

1) $\neg\neg\phi \Leftrightarrow \phi$

Double negation

2) $\phi \wedge \psi \Leftrightarrow \psi \wedge \phi$

Commutativity

3) $\phi \vee \psi \Leftrightarrow \psi \vee \phi$

4) $\phi \wedge (\psi \vee \chi) \Leftrightarrow (\phi \wedge \psi) \vee (\phi \wedge \chi)$

Distributivity

5) $\phi \vee (\psi \wedge \chi) \Leftrightarrow (\phi \vee \psi) \wedge (\phi \vee \chi)$

6) $\neg(\phi \wedge \psi) \Leftrightarrow \neg\phi \vee \neg\psi$

de Morgan's
Laws

7) $\neg(\phi \vee \psi) \Leftrightarrow \neg\phi \wedge \neg\psi$

8) $\phi \rightarrow \neg\psi \Leftrightarrow \psi \rightarrow \neg\phi$

Law of
Contraposition

9) $\phi \rightarrow \psi \Leftrightarrow \neg\phi \vee \psi$

10) $\neg(\phi \rightarrow \psi) \Leftrightarrow \phi \wedge \neg\psi$

Logical Equivalence Theorems

Quantifiers

$$11) \quad \neg \forall x \phi \Leftrightarrow \exists x \neg \phi$$

Quantifier negation

$$12) \quad \neg \exists x \phi \Leftrightarrow \forall x \neg \phi$$

$$13) \quad \forall x (\phi \wedge \psi) \Leftrightarrow \forall x \phi \wedge \forall x \psi$$

Quantifier distribution

$$14) \quad \exists x (\phi \vee \psi) \Leftrightarrow \exists x \phi \vee \exists x \psi$$

$$15) \quad \forall x \forall y \phi \Leftrightarrow \forall y \forall x \phi$$

Quantifier swap

$$16) \quad \exists x \exists y \phi \Leftrightarrow \exists y \exists x \phi$$

$$17) \quad \exists x \forall y \phi \Rightarrow \forall y \exists x \phi$$

... but not vice versa!

Logical Equivalence Theorems

Quantifiers and variables

The following equivalences are valid theorems of FOL, provided that x does not occur free in ϕ :

Here, $\phi[x/y]$ is the result of replacing all free occurrences of y in ϕ with x

$$18) \exists y\phi \Leftrightarrow \exists x\phi[x/y]$$

$$19) \forall y\phi \Leftrightarrow \forall x\phi[x/y]$$

$$20) \phi \wedge \forall x\Psi \Leftrightarrow \forall x(\phi \wedge \Psi)$$

$$21) \phi \wedge \exists x\Psi \Leftrightarrow \exists x(\phi \wedge \Psi)$$

$$22) \phi \vee \forall x\Psi \Leftrightarrow \forall x(\phi \vee \Psi)$$

$$23) \phi \vee \exists x\Psi \Leftrightarrow \exists x(\phi \vee \Psi)$$

$$24) \phi \rightarrow \forall x\Psi \Leftrightarrow \forall x(\phi \rightarrow \Psi)$$

$$25) \phi \rightarrow \exists x\Psi \Leftrightarrow \exists x(\phi \rightarrow \Psi)$$

$$26) \exists x\Psi \rightarrow \phi \Leftrightarrow \forall x(\Psi \rightarrow \phi)$$

$$27) \forall x\Psi \rightarrow \phi \Leftrightarrow \exists x(\Psi \rightarrow \phi)$$

Equivalence Transformations

Example

1. $\neg \exists x \forall y (Py \rightarrow Rxy)$ “Nobody masters every problem”
2. $\forall x \exists y (Py \wedge \neg Rxy)$ “Everybody fails to master some problem”

We show the equivalence of 1. and 2. as follows:

$$\neg \exists x \forall y (Py \rightarrow Rxy)$$

$$\Leftrightarrow \forall x \neg \forall y (Py \rightarrow Rxy)$$

$$\Leftrightarrow \forall x \exists y \neg (Py \rightarrow Rxy)$$

$$\Leftrightarrow \forall x \exists y (Py \wedge \neg Rxy)$$

$$(12) \neg \exists x \phi \Leftrightarrow \forall x \neg \phi$$

$$(11) \neg \forall x \phi \Leftrightarrow \exists x \neg \phi$$

$$(10) \neg (\phi \rightarrow \psi) \Leftrightarrow \phi \wedge \neg \psi$$
